## Deconfinement, Chiral Symmetry Breaking and Chiral Polarization

*Tuesday, 24 June 2014 14:35 (20 minutes)*

We examine the feasibility of the proposition that in  $N_f=0$  QCD there is a temperature range ( $T_c < T < T_{ch}$ ) where real Polyakov line (deconfined) vacuum exhibits valence spontaneous chiral symmetry breaking and dynamical chiral polarization of Dirac eigenmodes.
