Non-perturbative Renormalization of Four-fermion Operators Relevant to B_K with Staggered Quarks.

Tuesday, 24 June 2014 17:10 (20 minutes)

We present matching factors for the four-fermion operators obtained using the non-perturbative renormalization method (NPR) in RI-MOM scheme for improved staggered fermions on the MILC asqtad lattice ($N_f = 2+1$).

Using $20^3 * 64$ lattice (a = 0.12 fm, am_l/am_s = 0.01/0.05), we obtain the matching factor of B_K operator. Also we are in the middle of data analysis on the BSM operators.

These results will be used to obtain B_K and the BSM B-parameters.

We expect that the matching factor error obtained using NPR is in the level of ~2% which is much smaller than that of the one-loop perturbative matching (~4.4%).

We compare NPR results with those of one-loop perturbative matching.
