Lattice Calculation of the Hadronic Light by Light Contributions to the Muon Anomalous Magnetic Moment

Monday, 23 June 2014 15:35 (20 minutes)

The anomalous magnetic moment of muon, g-2, is a very precisely measured quantity. However, the current measurement disgrees with standard model by about 3σ . Hadronic vaccum polarization and hadronic light by light are the two types of processes that contribute most to the theorectial uncertainty. We will discuss the light by light lattice calculation and some strategies of including QED on lattice.
