

Short update on the backward-angle π^0 Production

Bill and Bernard on behalf of backward meson production group

- Bill merged the EIC exclusive charged pion production generator into a C++ coding platform
- Bill is now working on this platform to make it more general (by separating the physics section of the code and make it modular)
- The same platform could be used for other processes (such as backward-angle DVCS) in the EIC
- Justin Stevens will give an update on our progress at the Temple meeting in March
- Any question or interested in helping, contact Bill: billlee@jlab.org
