

Path forward for “DAQ and electronics” SWG

DAQ/Electronics

- *Define and consider some different scenarios of trigger-less options*
- *Evaluate and define implications for front-end electronics of streaming options*

We fully support both suggestions, and we are actually already working on these.

We prepared two template documents to characterize FEE solutions and TDAQ solutions (google documents), sharing these with the working group members.

We explicitly asked BNL people (J. Huang et al) and eR&D23 spokespersons to summarize their work as two scenarios in the TDAQ document.

We'll review the status of the work at our next WG meeting (early April).
