## Dihadrons at the EIC

Christopher Dilks
Yellow Report Workshop Pavia
May 2020

## Outline

- Introduction
- Event Selection and Monte Carlo Details
- $\mathrm{x}, \mathrm{Q}^{2}$ planes and binning
- Effects of y cuts
- Polar plots
- Effects of acceptance limits
- Dihadron kinematics
- PID performance

## Dihadrons: Probing Spin-Orbit Correlations in Hadronization

## Unpolarized SIDIS:

$\checkmark$ Cahn Effect: quark transverse momentum leads to azimuthal modulations of SIDIS cross section
Boer-Mulders Effect: Non-collinear quarks in an unpolarized proton can have transverse polarization, also contributing azimuthal modulations

Boer-Mulders and Cahn effects are comparable in single hadron production

- HERMES and COMPASS data, e.g. Phys.Rev.D 81 (2010) 114026
- Dihadrons can help decouple BM from Cahn
- Extra degree of freedom in dihadrons
- Cahn effect impacts dihadron total momentum direction $P_{h}$
- Utilize azimuthal angle about $P_{h}$, in addition to the azimuth about the virtual photon

## Advantages from a broader and higher $\mathbf{Q}^{2}$ range at an EIC

- Broader $Q^{2}$ range probes evolution effects
- Higher $\mathrm{Q}^{2}$ suppresses Cahn effect in single-hadron asymmetries (Cahn is twist-4)
- Lower $Q^{2}$ for overlap with other SIDIS experiments

## Dihadrons: Probing Spin-Orbit Correlations in Hadronization

## Longitudinally polarized SIDIS:

- Helicity DiFF $G_{1}{ }^{\perp}$ :
- Not yet constrained by data!
- Spin-orbit correlations in hadronization

- Fragmenting quark acquires transverse polarization via 'wormgear' splitting in the quark-jet hadronization model
- Preliminary CLAS12 data indicate significant effect, dependent on invariant mass

Collinear Twist-3 PDFs e(x) and $h_{\llcorner }(x)$ :

- CLAS6 data provided the first $\mathrm{e}(\mathrm{x})$ extraction, consistent with models; CLAS12 data are in agreement
- Physical Interpretation via moments of $\mathrm{e}(\mathrm{x})$ :
- Transverse color-force on a transversely polarized struck-quark, in an unpolarized proton
- $\pi N$ sigma terms:
- Quark mass contribution to proton mass
- Quark chromomagnetic dipole moment $\rightarrow \mathrm{CP}$-odd $\pi-\mathrm{N}$ coupling
- No experimental constraints yet for $h_{L}(x)$

## Dihadrons: Probing Spin-Orbit Correlations in Hadronization

## Transversely polarized SIDIS:

Access to several additional TMDs:

- Transversity $\rightarrow$ Tensor Charge

$$
\delta q=\int_{-1}^{1} d x h(x)=\int_{0}^{1} d x[h(x)-\bar{h}(x)]
$$

- Quark EDM contribution to nucleon EDM
$\rightarrow$ CP violation
- Comparisons with lattice QCD calculation
- Sivers Function
- Kotzinian-Mulders (wormgear) Function
- Pretzelocity
- Twist-3 TMDs

$$
\begin{array}{|llll|}
\hline F_{U T} & f_{1 T}^{\perp} \otimes D_{1}+g_{1 T} \otimes G_{1} & f_{T} \otimes D_{1} & h_{T} \otimes H_{1} \\
& h_{1} \otimes H_{1} & f_{T}^{\perp} \otimes D_{1} & h_{T}^{\perp} \otimes H_{1} \\
& h_{1 T}^{\perp} \otimes H_{1} & & \\
\hline F_{L T} & g_{1 T} \otimes D_{1}+f_{1 T}^{\perp} \otimes G_{1} & g_{T} \otimes D_{1} & e_{T} \otimes H_{1} \\
& & g_{T}^{\perp} \otimes D_{1} & e_{T}^{\perp} \otimes H_{1} \\
\hline
\end{array}
$$

Twist-2 TMDs

| $\mathbf{N} / \mathbf{q}$ | $\mathbf{U}$ | $\mathbf{L}$ | $\mathbf{T}$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{U}$ | $f_{1}$ |  | $h_{1}^{\perp}$ |
| $\mathbf{L}$ |  | $g_{1}$ | $h_{1 L}^{\perp}$ |
| $\mathbf{T}$ | $f_{1 T}^{\perp}$ | $g_{1 T}$ | $h_{1 T}, h_{1 T}^{\perp}$ |

Twist-3 TMDs

| $\mathbf{N} / \mathbf{q}$ | $\mathbf{U}$ | $\mathbf{L}$ | $\mathbf{T}$ |

## Dihadron Fragmentation and Partial Waves

$$
H_{1}^{\perp}=\sum_{\ell=0}^{\ell_{\max }} \sum_{m=-\ell}^{\ell} \underline{P_{\ell, m}(\cos \vartheta)} e^{i m\left(\phi_{R_{\perp}}-\phi_{p}\right)} H_{1}^{\perp|\ell, m\rangle}\left(z, M_{h},\left|\boldsymbol{p}_{T}\right|\right)
$$

Dihadron Fragmentation Functions (DiFFs)

| $h_{1} h_{2} / q$ | $\mathbf{U}$ | $\mathbf{L}$ | $\mathbf{T}$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{U U}$ | $D_{1, O O}$ |  | $H_{1, O O}^{\perp}$ |
| $\mathbf{L U}$ | $D_{1, O L}$ |  | $H_{1, O L}^{\perp}$ |
| $\mathbf{L L}$ | $D_{1, L L}$ | $H_{1, L L}^{\perp}$ |  |
| $\mathbf{T U}$ | $D_{1, O T}$ | $G_{1, O T}^{\perp}$ | $\begin{cases}H_{1, O T}^{\perp} & \text { if } m<0 \\ H_{1, O T}^{\triangleleft} & \text { if } m>0\end{cases}$ |
| $\mathbf{T L}$ | $D_{1, L T}$ | $G_{1, L T}^{\perp}$ | $\begin{cases}H_{1, L T}^{\perp} & \text { if } m<0 \\ H_{1, L T}^{\triangleleft} & \text { if } m>0\end{cases}$ |
| $\mathbf{T T}$ | $D_{1, T T}$ | $G_{1, T T}^{\perp}$ | $\begin{cases}H_{1, T T}^{\perp} & \text { if } m<0 \\ H_{1, T T}^{\triangleleft} & \text { if } m>0\end{cases}$ |

- DiFFs expand in partial waves
- Access to interference between dihadrons with relative angular momenta
- ss, sp, pp interference

## Dihadron Kinematics

Dihadron CoM production angle:

## Monte Carlo

- Event Generation
- Pythia6 (via pythiaeRHIC)
- 1M events

Energies:

- $5 \times 41 \quad \sqrt{ }=28.7 \mathrm{GeV}$
- $5 \times 100$ Vs $=44.7 \mathrm{GeV}$
- $10 \times 100 \mathrm{Vs}=63.3 \mathrm{GeV}$
- $18 \times 275$ Vs $=140.7 \mathrm{GeV}$
- Radiative corrections using RADGEN attempted, but was unsuccessful
- Using steer file obtained from Elke
- Kinematic maps below focus on low and high CoM energy: $5 \times 41$ and $18 \times 275$
- Fast Simulation
- `eic_smear` with the `handbook` detector setting (via eJANA)
- Require the electron and hadron $E$ and $P$ to be smeared (in tracker+calorimeter)
$\square$ Analysis
- DIS kinematics reconstructed using highest-energy scattered electron
- Pions and Kaons are paired inclusively
- PID studies
- Architecture for asymmetry fits / projections is ready
- Uses same code for a parallel analysis at CLAS
- Projections for partial wave amplitudes is also possible

## Event Selection

$Q^{2}>1 \mathrm{GeV}^{2}$ athosemensemem
$W>3 \mathrm{GeV}$ exclude elastic / resonance region
$0.01<y<0.95 \begin{aligned} & \text { lower bound is to avoid region in which calculating } \mathrm{x} \text {, } \mathrm{Q} 2 \text {, etc. via the e' } \\ & \text { momentum may be insufficient }\end{aligned}$
$X_{F_{h}}>0$ help ensure hadrons are produced in the current fragmentation region
$Z_{h}>0.01$ cuts out long $M_{h}$ tail at $z \sim 0$ peak (need to think about...)
$z h_{1} h_{2}<0.95$ helps avoid exclusive region

## Focusing on $\pi^{+} \pi^{-}$channel

## ( $\mathrm{x}, \mathrm{Q}^{2}$ ) Planes, with Binning

Diagonal lines show $y$ contour at the cut of 0.01 , along with the CLAS12 upper limit ( $y=1$ )

- $18 \times 275$ plot includes data with $\mathrm{y}<0.01$
- Kinematic reach of $5 \times 41$ with Q2>1 does not extend to $y<0.01$, but overlaps with CLAS12Vertical / horizontal lines demarcate ( $\mathrm{x}, \mathrm{Q}^{2}$ ) bin boundaries, used in the following slidesNext slides show matrices of plots corresponding to these bins

## Low-y Studies: effects of y cuts

Smearing Disabled

DIS kinematics calculated using scattered electron are not reliable for $y<0.01$By $y=0.1$, there are already differences up to $15 \%$
(small fraction of high-y discrepancies not studied)

## Effects of $y$ cut on $p_{T}$

Smearing Disabled
$5 \times 41 \mathrm{GeV}$

This shows $\pi+p_{T}$ versus $y$; black line indicates $y=0.01$

- 4 plot matrix corresponds to binning shown on ( $\mathrm{x}, \mathrm{Q}^{2}$ ) planes aboveThe impact of $y>0.01$ cut is negligibleHigher y cuts may start to shave away low $\mathrm{p}_{\mathrm{T}}$ at high-x and low $\mathrm{Q}^{2}$

Effects of $y$ cut on $q_{T}\left(=P_{h}^{\perp} / z_{\text {pair }}\right)$
5x41 GeV

Compare to $q_{T}$ versus $y$; black line indicates $y=0.01$

- Mean $q_{T}$ will decrease a bit as $y$ cut is increased

Smearing Disabled
$18 \times 275 \mathrm{GeV}$

## Aside: Alternative methods for calculating ( $\mathrm{x}, \mathrm{Q}^{2}$ )

Study from Anselm

Fraction of events staying in bin (10x100)

Fraction of events staying in bin (10x100)

# Aside: Alternative methods for calculating ( $\mathrm{x}, \mathrm{Q}^{2}$ ) 

Study from Anselm

Fraction of events staying in bin (18×275)

Fraction of events staying in bin (18×275)

## Aside: Alternative methods for calculating ( $\mathrm{x}, \mathrm{Q}^{2}$ )

Fraction of missing energy, from acceptance limits
Larger fraction at low-y $\rightarrow$ correlates to inaccuracy of ( $\mathrm{x}, \mathrm{Q}^{2}$ )

Pion Momentum

## 5x41 GeV

$\pi^{+}$, for $1<Q^{2}<3$ and $1 e-05<x<0.025$

$\pi^{+}$, for $1<Q^{2}<3$ and $0.025<x<1$

$18 \times 275 \mathrm{GeV}$
$\pi^{+}$, for $10<Q^{2}<3000$ and $1 e-05<x<0.005$

$\pi^{+}$, for $1<Q^{2}<10$ and $1 \mathrm{e}-05<x<0.005$

$\pi^{+}$, for $10<Q^{2}<3000$ and $0.005<x<1$

$\pi^{+}$, for $1<Q^{2}<10$ and $0.005<x<1$
Radius set at 30 GeV ; compare to next slide's zoomed plotSmearing with eic-smear enabled $\rightarrow$ acceptance cuts at $|\eta|=3.5$This is for $\pi+$ of $\pi+\pi$ - dihadrons, but the $\pi$ - looks the same

## Pion Momentum

## 5x41 GeV

$\pi^{+}$, for $1<Q^{2}<3$ and $1 e-05<x<0.025$

$\pi^{+}$, for $3<Q^{2}<3000$ and $0.025<x<1$

$\pi^{+}$, for $1<Q^{2}<3$ and $0.025<x<1$

$18 \times 275 \mathrm{GeV}$
$\pi^{+}$, for $10<Q^{2}<3000$ and $1 e-05<x<0.005$
$\pi^{+}$, for $10<Q^{2}<3000$ and $0.005<x<1$

$\pi^{+}$, for $1<Q^{2}<10$ and $1 \mathrm{e}-05<x<0.005$

$\pi^{+}$, for $1<Q^{2}<10$ and $0.005<x<1$
Radius set at 10 GeVSmearing with eic-smear enabled $\rightarrow$ acceptance cuts at $|\eta|=3.5$This is for $\pi+$ of $\pi+\pi$ - dihadrons, but the $\pi$ - looks the sameSome backward production at low x

Pion Momentum vs. Pseudorapidity
5x41 GeV

Smearing disabled, to show activity beyond acceptance cuts

- Enabling smearing does not alter the shape of the distributions muchLines for $|\eta|=3.5$ are shownAcceptance cuts only effect $p<\sim 4 \mathrm{GeV}$$\pi / \mathrm{K} / \mathrm{p}$ separation up to $\mathrm{p} \sim 8 \mathrm{GeV}$ is sufficient

Pion Transverse Momentum vs. Pseudorapidity
Smearing Disabled

$\square$ Smearing disabled, to show activity beyond acceptance cuts

- Enabling smearing does not alter the shape of the distributions muchHorizontal lines for $|\eta|=3.5$Impact of acceptance cuts is primarily on low $\mathrm{p}_{\mathrm{T}}$, well below the 500 MeV threshold (vertical lines)

## Effects of $\eta$ cuts on $q_{T}$

## Smearing Disabled

$5 \times 41 \mathrm{GeV}$

Plots show $q_{T}=P_{h}{ }^{\perp} / z_{\text {pair }}$
vs. $\eta$ of $\pi+$

- Smearing disabled, to show activity beyond acceptance cutsVertical lines for $|\eta|=3.5$
- Little impact of acceptance cuts on $q_{T}$

## Effects of $p_{T}$ cuts on $q_{T}$

Smearing Disabled

$5 \times 41 \mathrm{GeV}$

Plots show $q_{T}$ vs. $p_{T}$ of $\pi+$

- Smearing disabled, to show activity beyond acceptance cutsVertical lines $p_{T}=500 \mathrm{MeV}$Higher $p_{T}$ cuts may have mild impact at low $q_{T}$

## Dihadron Kinematics: Invariant Mass

5x41 GeV

$\pi^{+} \pi M_{n}$ distribution, for $1<Q^{2}<3$ and $1 e-05<x<0.025$

$\pi^{+} \pi^{-} \mathrm{M}_{\mathrm{h}}$ distribution, for $1<\mathrm{Q}^{2}<3$ and $0.025<x<1$

$18 \times 275 \mathrm{GeV}$

$\pi^{*} \pi M_{n}$ distribution, for $1<Q^{2}<10$ and $1 e-05<x<0.00$

$\pi^{+} \pi \pi_{n} M_{n}$ distribution, for $10<Q^{2}<3000$ and $0.005<x<1$

$\pi^{+} \pi^{-} M_{h}$ distribution, for $1<Q^{2}<10$ and $0.005<x<1$

- Strong $\mathrm{K}_{\mathrm{s}}$ peak seen, not smeared very much
- peak also visibleNot much dependence on $\mathrm{x}, \mathrm{Q}^{2}$, or $\sqrt{ } \mathrm{s}$

Dihadron Kinematics: Azimuthal correlations $\boldsymbol{\phi}_{\mathrm{h}}$ vs. $\boldsymbol{\phi}_{\mathrm{R}}$
$18 \times 275 \mathrm{GeV}$

$\pi^{+} \pi^{*} \phi_{h}$ vs. $\phi_{R}$, for $1<Q^{2}<3$ and $0.025<x<1$

$\pi^{+} \pi \phi_{\mathrm{h}}$ vs. $\phi_{\mathrm{R}}$, for $10<Q^{2}<3000$ and $1 \mathrm{e}-05<x<0.005$

$\pi^{+} \pi \phi_{h}$ vs. $\phi_{R^{\prime}}$ for $1<Q^{2}<10$ and $1 e-05<x<0.005$

$\square \phi_{h}$ peaks at $\pm \pi$ indicate a strong tendency of dihadron momentum sum $P_{h}$ to be in lepton scattering plane, with $\mathrm{P}_{\mathrm{h}}{ }^{\perp}$ opposite of $\mathrm{p}_{\mathrm{e}}{ }^{\perp}$, where " $\perp$ " denotes the plane transverse to q

- Similar shape seen in $\phi_{h}$ of single hadrons
$\phi_{R}$ peaks at $\pm \pi$ and 0 indicate the hadrons also tend to be within the lepton scattering plane
These shapes are also present in the generated (not smeared) sample

Dihadron Kinematics: CoM Frame Production Angle

- $\theta$ represents the "decay" angle of the hadron pair, in the rest frame of the dihadronDihadron Fragmentation Functions are expanded in partial waves, parameterized by $\theta$
- Sensitivity to ss, sp, pp interference of dihadroproductionIdeal distribution follows a $\sin \theta$ shapeDouble peaking visible at low-x and high $\mathrm{Q}^{2}$

Dihadron Kinematics: $\boldsymbol{\theta}$ vs. $\mathbf{P}_{\mathrm{h}}$

$18 \times 275 \mathrm{GeV}$

$\pi^{+} \pi^{*} \theta$ vs. $p$, for $1<Q^{2}<10$ and $0.005<x<1$

## PID Performance

Using $2 \sigma$ separation:

Using $3 \sigma$ separation:

- Fraction of reconstructed $\pi \pi$ pairs
- Fraction of reconstructed $\pi \boldsymbol{K}$ pairs
- Fraction of reconstructed KK pairs

Study from Anselm

## PID Performance

$\pi^{0}$ Reconstruction with $\mathrm{E}_{\mathrm{y}}>200 \mathrm{MeV}$

$\eta$ Reconstruction with $\mathrm{E}_{\gamma}>200 \mathrm{MeV}$

## Summary and Outlook

- Dihadrons access several aspects of the nucleon:
- Spin-momentum correlations in hadronsization
- Transverse-momentum dependent PDFs
- Twist-3 TMD PDFs
- EIC simulation studies are well underway
- Next Steps:
- Asymmetry projections, including partial wave sensitivity
- Study other dihadron channels, including kaons
