

# e+D Full Simulations with BeAGLE Events

Alex Jentsch

4/16/2020

# Preliminaries

- 18 (GeV) x 135 (GeV/n) e+D events with BeAGLE.
- Results for neutron spectator and proton spectator shown separately.
- ZDC:  $\sigma_E \sim \frac{50\%}{\sqrt{E}} + 5\%$ ,  $\sigma_\theta \sim \frac{3 \text{ mrad}}{\sqrt{E}}$
- External Silicon Sensors:  $500\mu\text{m} \times 500\mu\text{m}$  pixels
- B0:  $50\mu\text{m} \times 50\mu\text{m}$  pixels
- Angular divergence numbers from “high acceptance – 18x275 GeV – full scope” portion of “eRHIC parameters v6.0” table.
- Beam energy spread  $\sim 10^{-4}$
- Vertex smearing (to simulate the crab cavity effect)

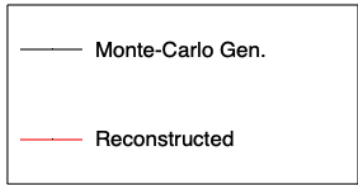

# Simulation Apparatus

- EicRoot with GEANT4
- Includes ZDC, B0 sensors, Roman Pots, and External Silicon Sensors for particles with different rigidity.

# Proton Spectator

# Proton Spectator

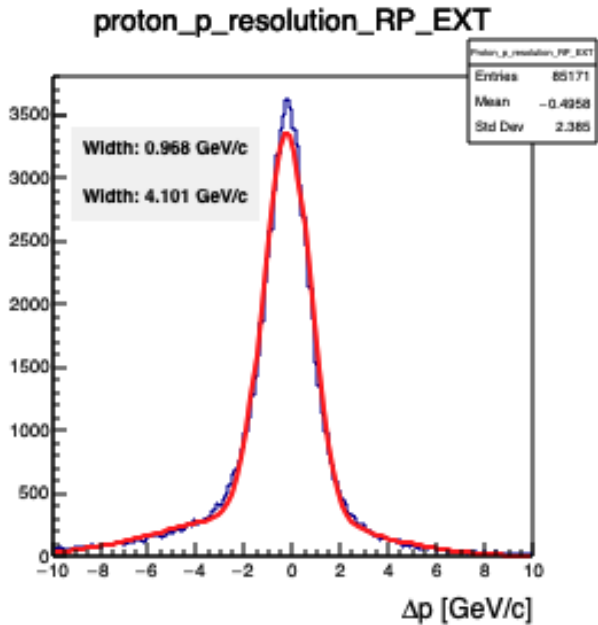

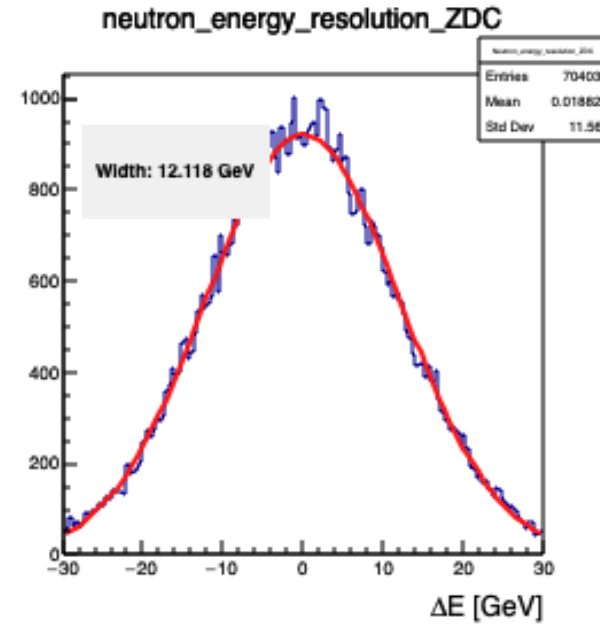

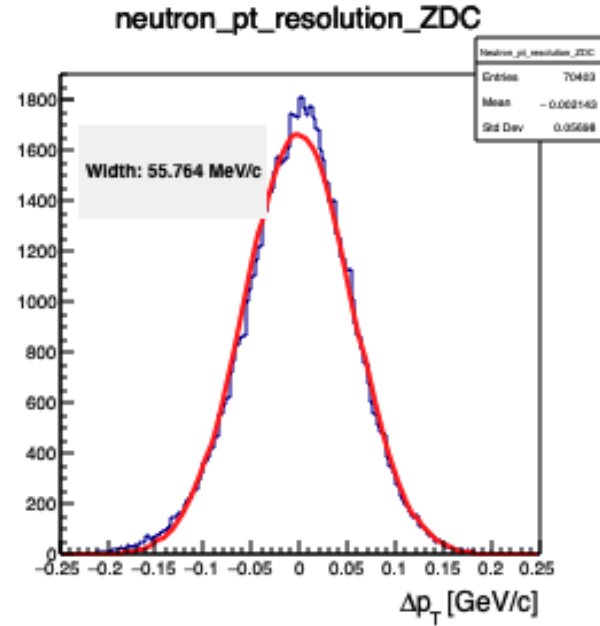

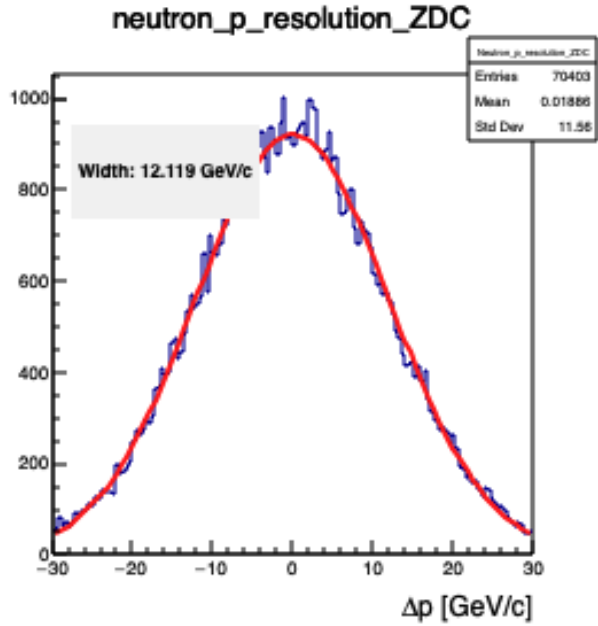

## Protons

## Neutrons

# Proton Spectator

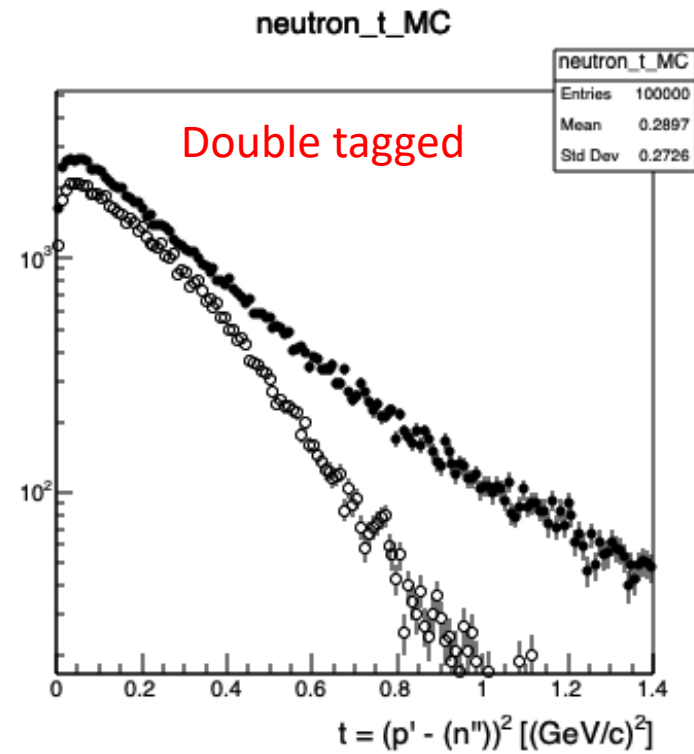

The widths calculated here include all of the smearing contributions mentioned earlier.

The percent resolution vs. pt will be shown later, as well as a table summarizing the individual contributions.

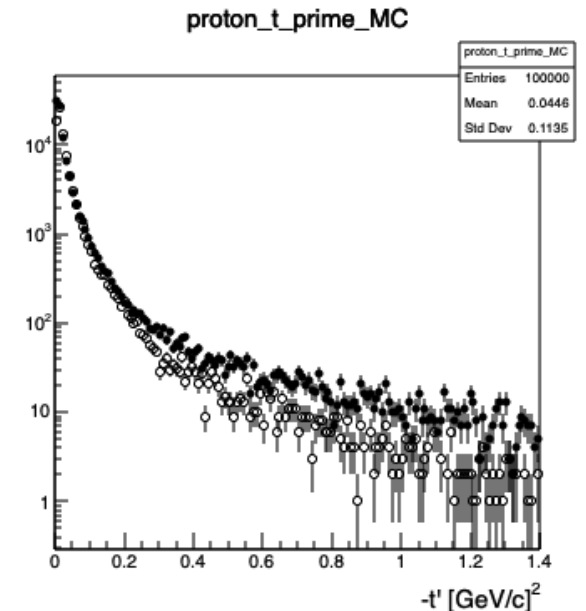

# Proton Spectator

- Acceptance for double-tagging could be *slightly* improved when the Roman Pots are included, and when the detector solenoid are included.
- Effects of smearing can be seen by inspection in many plots, but quantifying the effect on physics depends on what you are extracting.

## Proton tagged

# Proton Spectator

proton\_reco\_pt\_vs\_MC\_pt

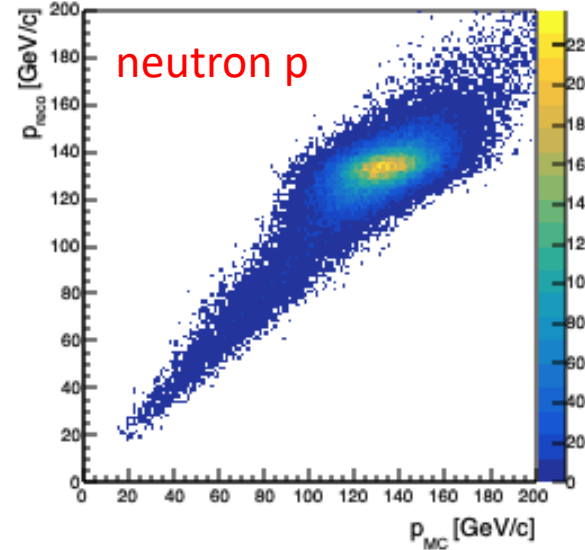

proton\_reco\_p\_vs\_MC\_p

neutron\_reco\_pt\_vs\_MC\_pt

neutron\_reco\_p\_vs\_MC\_p

- The protons that are significantly off energy start to have issue with the tracking since they are more strongly affected by the edge of quadrupole fields.
- Neutrons fall nicely on a straight line, with the width driven by the detector smearing.

# Neutron Spectator

# Neutron Spectator

## Protons

## Neutrons

# Neutron Spectator

- More off-energy protons adds some different effects in the proton smearing. I have used two Gaussians to fit these distributions.

# Neutron Spectator

- Acceptance for double-tagging could be *slightly* improved when the Roman Pots are included, and when the detector solenoid are included.
- Effects of smearing can be seen by inspection in many plots, but quantifying the effect on physics depends on what you are extracting.

proton\_t\_MC

# Neutron Spectator

proton\_reco\_pt\_vs\_MC\_pt

proton\_reco\_p\_vs\_MC\_p

neutron\_reco\_pt\_vs\_MC\_pt

neutron\_reco\_p\_vs\_MC\_p

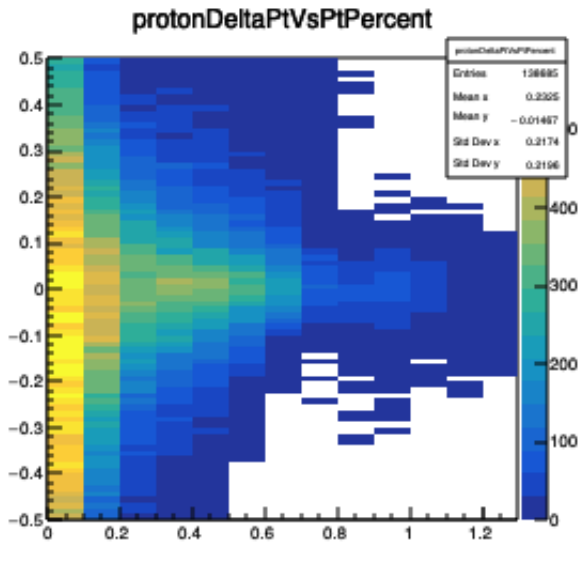

- The protons that are significantly off energy start to have issue with the tracking since they are more strongly affected by the edge of quadrupole fields.
- Neutrons fall nicely on a straight line, with the width driven by the detector smearing.

# Total Resolutions

protons (both cases combined)

neutrons (both cases combined)

# Table of smearing contributions

[MeV/c]	Angular Divergence	Crab Cavity (vtx. smearing)	Beam Energy Spread	Pixel Size	E Res./Ang.Res.	Reco. Smearing (transport matrix)	Notes
Proton (external sensors)	~30	~13	< nominal smearing*	~10	N/A	~7	Severely off energy particles have worse smearing overall.
Neutron	~30	~13	< nominal smearing*	N/A	35-50	N/A	In the struck case, we have more lower-p neutrons, which will provide a larger contribution from E res. smearing.

Total for protons in ESS ~30 MeV/c with proton spectators, ~48 MeV/c for struck protons.

Total for neutrons is ~38 MeV/c for spectators, ~ 55 MeV/c for struck neutrons.

\*Nominal smearing: smearing without any effects included. ~0 for neutrons, ~3 MeV/c for protons in ESS.

# Summary

- A comprehensive study of the acceptance and resolution of protons and neutrons from  $e+D$  nuclear breakup events in BeAGLE is now very mature.
  - Beam effects included, magnets/yokes included, etc.
- Need a few more days to do final checks, clean up plots, etc.
- Outlook
  - Energy dependence (i.e. lower energy configuration) could be studied.
  - $e+He3$  also needs a similar treatment.
  - What else?
