

# nFF status update

Corrected for bugs and  
various flavor definitions

**YR SIDIS sub-group meeting**  
**April 20**

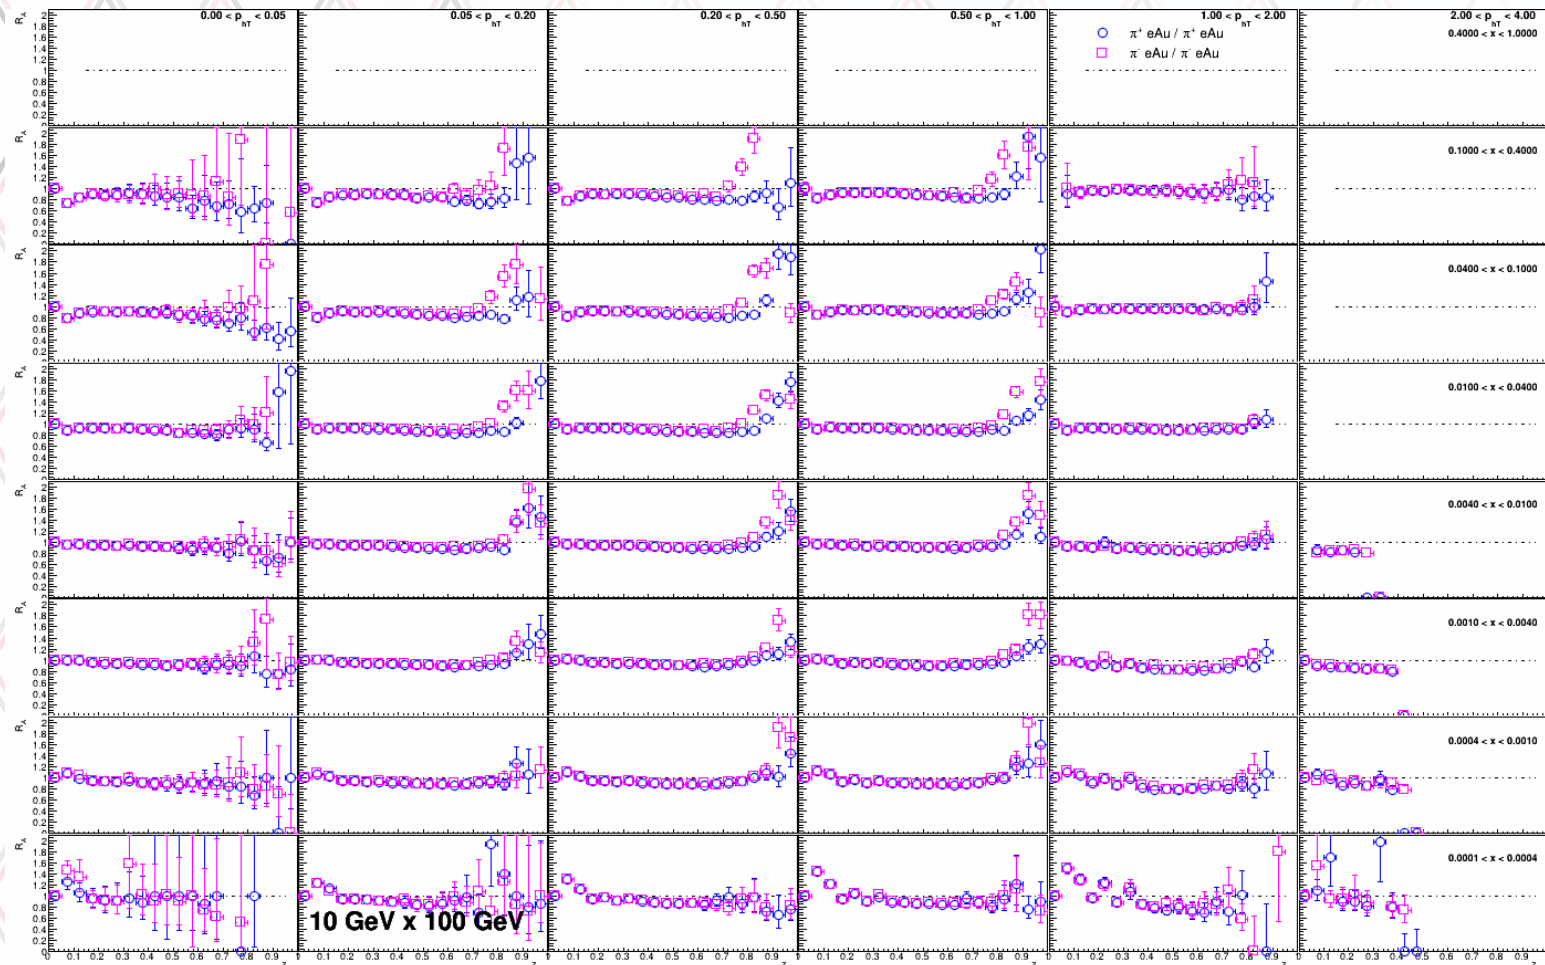

**Ralf Seidl (RIKEN)**

# nFF reweighting

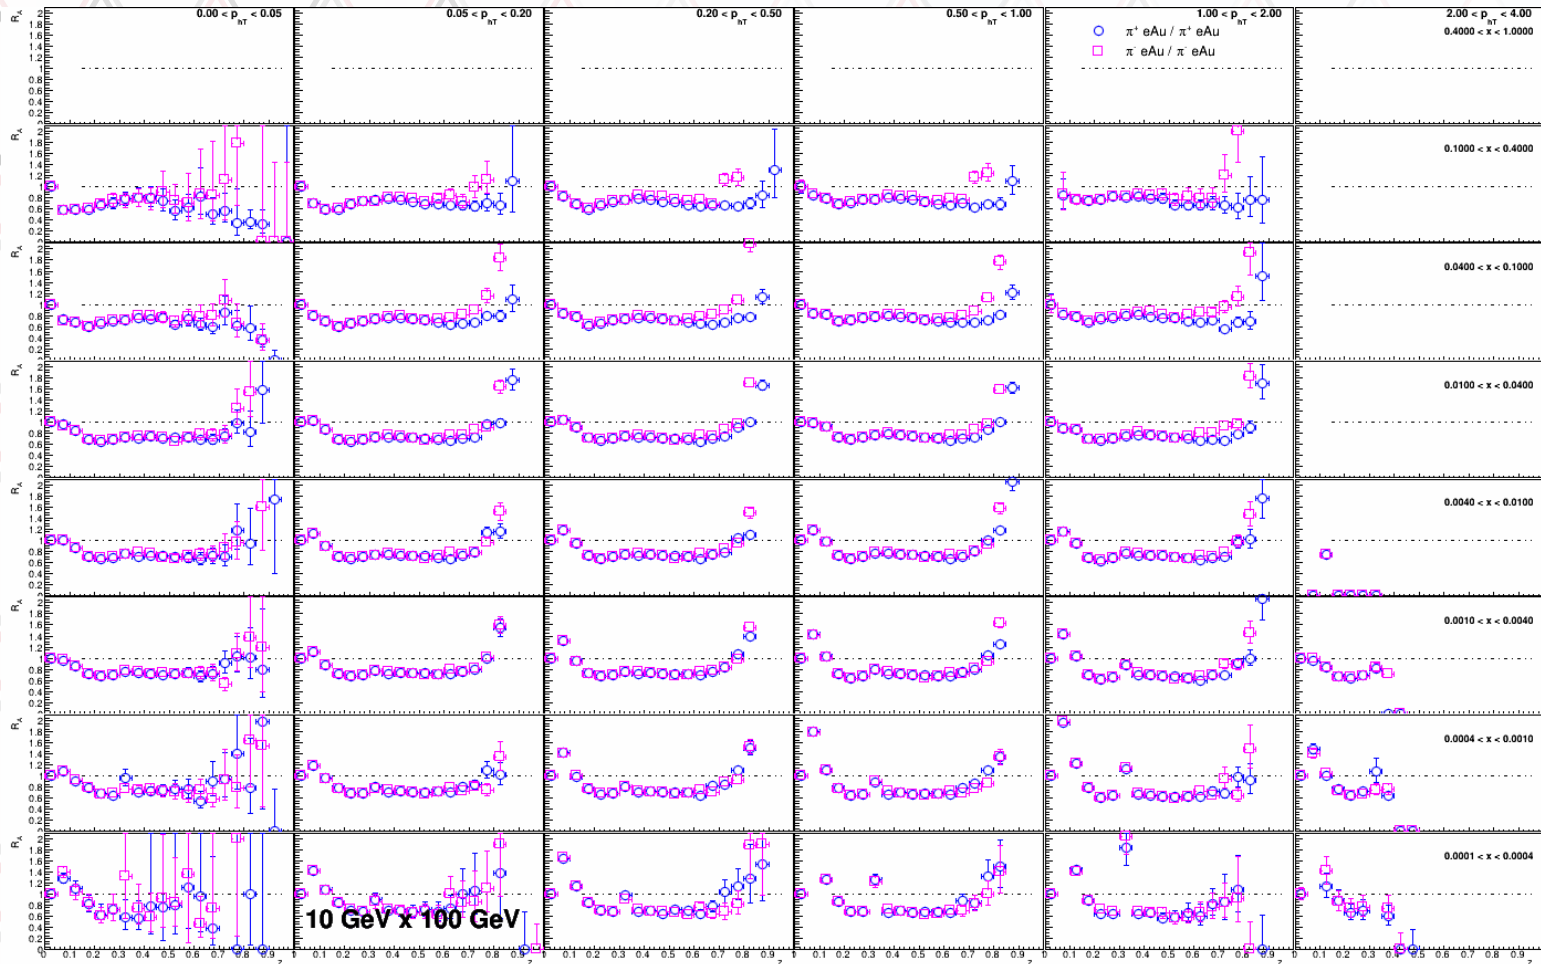

- From Pia I obtained the pion NLO grids from DSSZ and DSS including their interpolators
- Implemented calls to these fortran routines for pions in the covered **z range (>0.0099)** if pion got traced to a fragmenting parton in Processes 99, 131, 132, 135, 136 (now either using partons from ancestry (wrong), using parton flavor with closest angles to hadron or parton flavor and z from closest parton)
- Weighted the event with ratio of corresponding outputs, (e.g.

$$wgt = \frac{z D_{1,u}^{nFF}(z, Q^2)}{z D_{1,u}^{FF}(z, Q^2)}$$

# Ratios of eAu pions with reweighting over w/o

# Ratios of eAu pions with reweighting over w/o (using parton from matching)

$Z$

# Flavor from matching, default $z$

# Flavor and z from matching

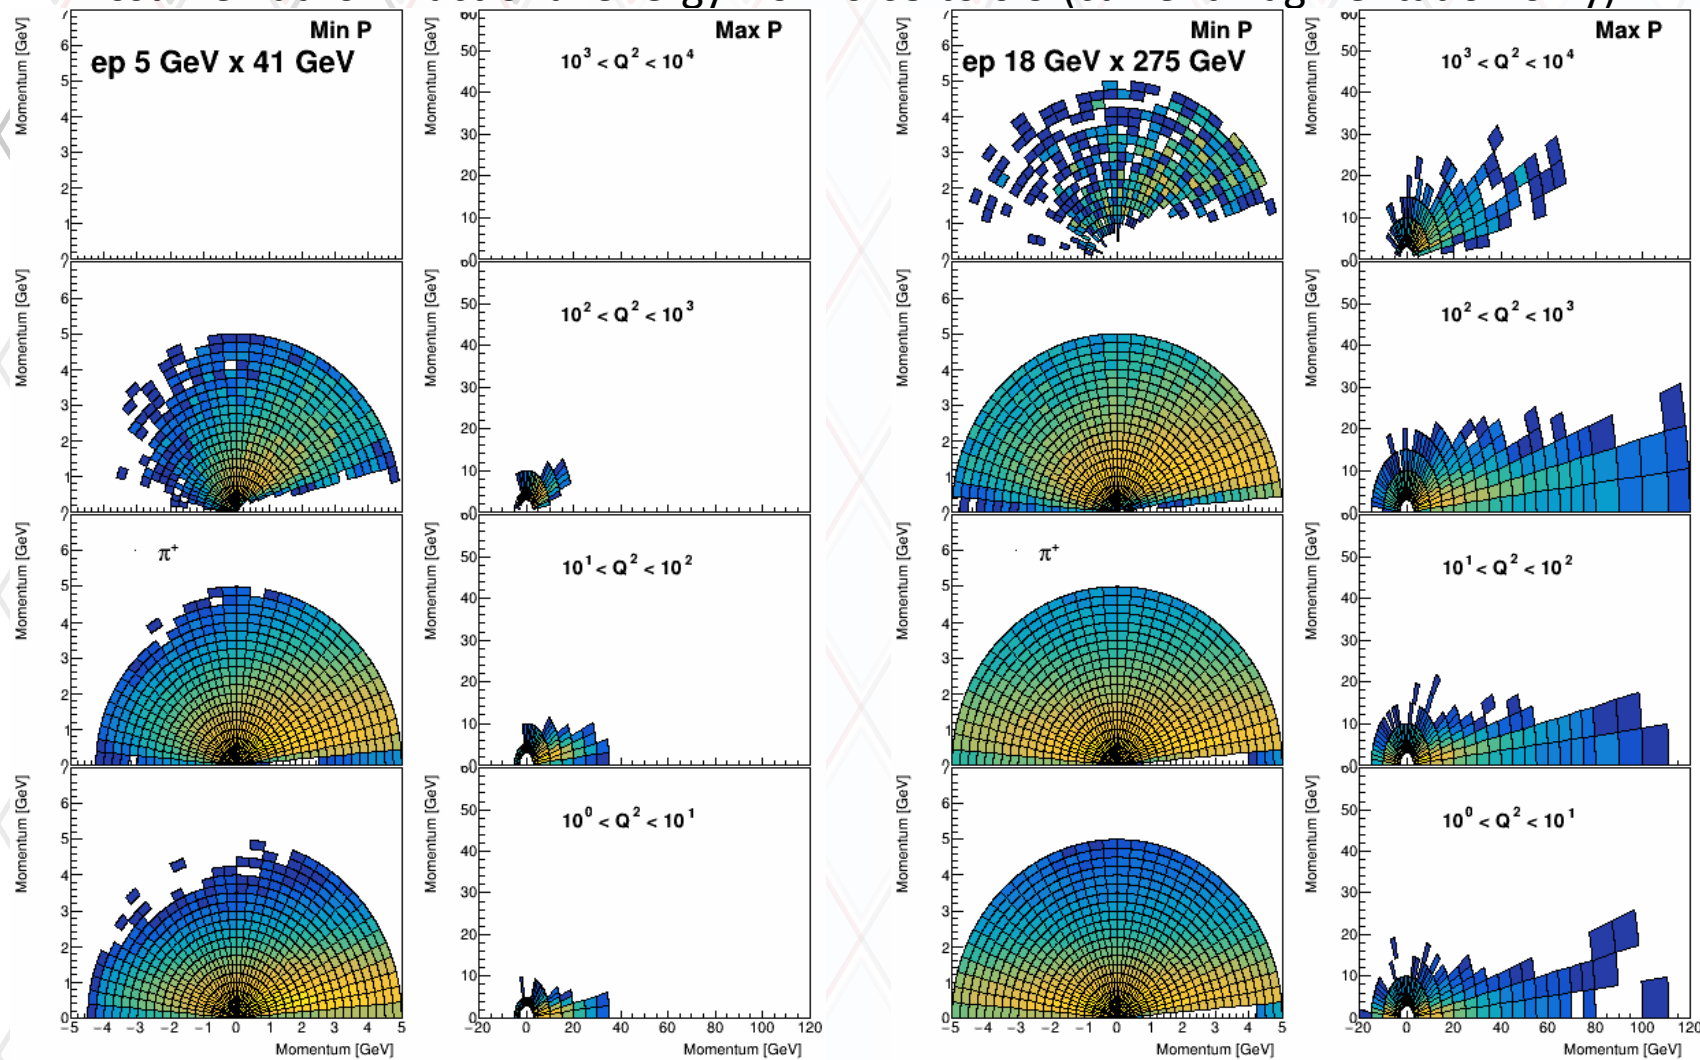

# Comments

- Always an enhancement seen at the lowest and highest covered  $z$  bins – lowest makes sense, but highest not clear
- Interpolation from grids is rather slow
  - slowdown of analysis code by a factor of more than 10
  - Use lookup tables (95  $z$  and 25  $Q^2$  bins) that are filled as needed which fixed speed problem

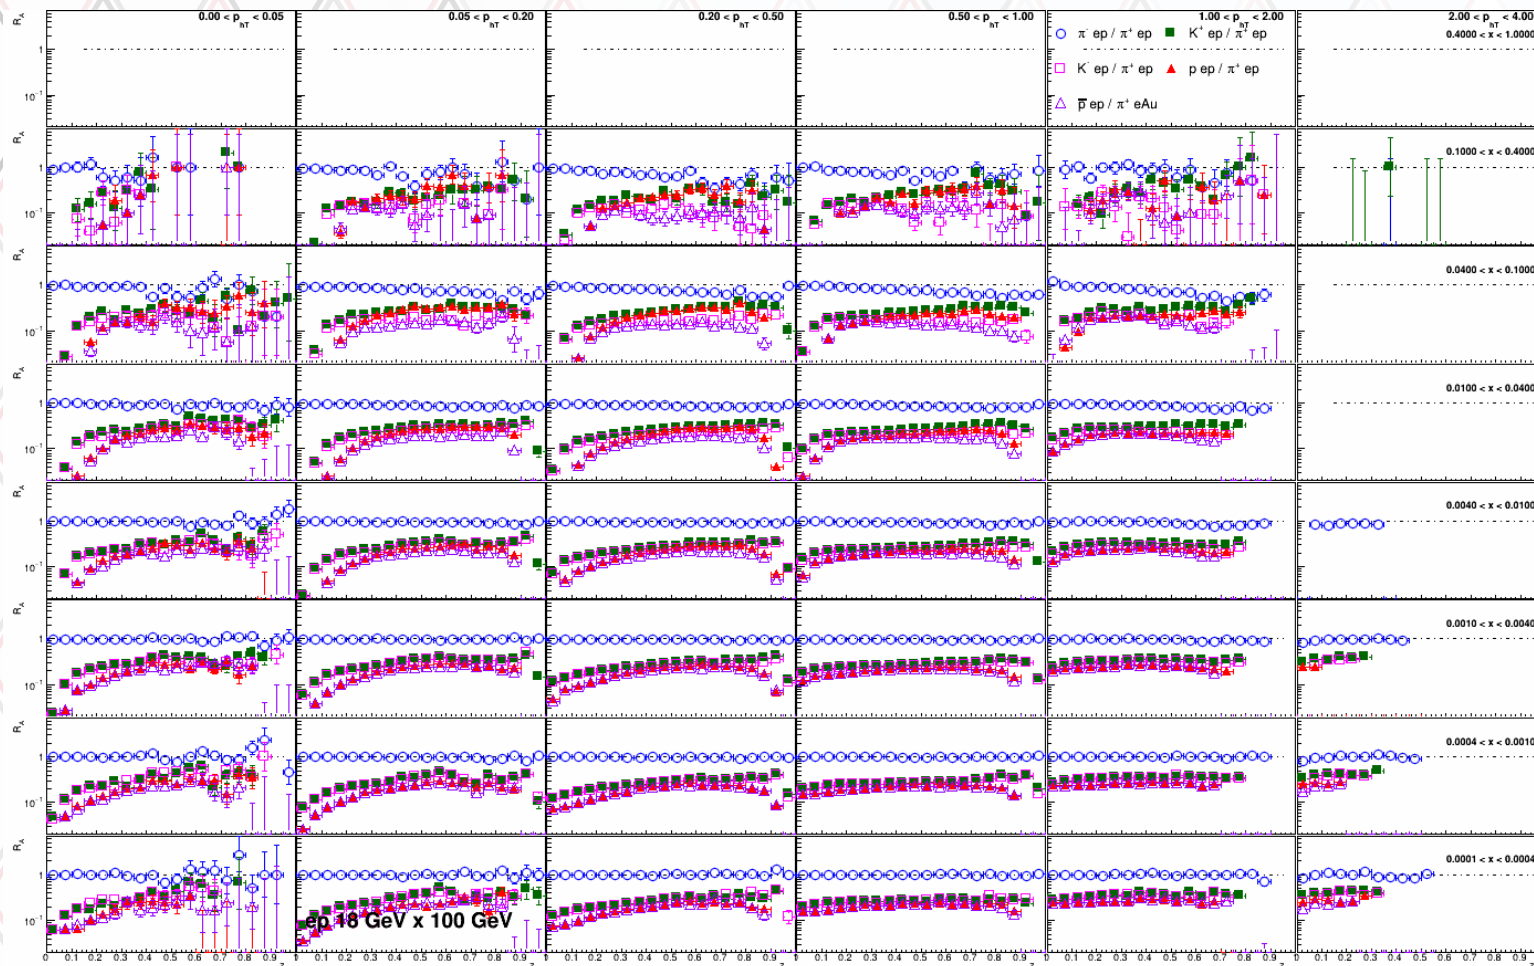

# For Detector group request: Energy ranges for SIDIS measurements (for PID detectors)

- Assume hadron fractional energy from 0.05 to 0.9 (current fragmentation only):
