# Why we need an EIC: the view from 10,000 meters

R. D. McKeown  
Jefferson Lab

QCD Town Meeting  
Sept. 13, 2014

# Why We Need EIC

- HERA discovered a very large abundance of soft gluons inside the proton. However, the role of gluons in nucleon structure and dynamics is still unclear.
- The origin of nucleon spin and the distributions of quarks and gluons in nuclei remain mysteries after decades of study.
- We have new phenomenology to explore nucleon structure: Generalized Parton Distributions (GPDs) and Transverse Momentum Dependent (TMDs) distributions that provide powerful “imaging” of quarks and gluons and access to orbital angular momentum. These studies will require high luminosity and polarized beams.
- A new facility, EIC, with a versatile range of kinematics, beam polarizations, and beam species, is required to precisely image the sea quarks and gluons in nucleons and nuclei, to explore the new QCD frontier of strong color fields in nuclei, and to resolve outstanding issues in understanding nucleons and nuclei in terms of QCD.

# Science Questions

- What is the transverse spatial and momentum structure of the gluons and sea quarks? Are there non-perturbative structures and can one image them?
- How much do the gluons contribute to the nucleon spin? Is there significant orbital angular momentum?
- How is the gluon distribution in nuclei different than in the nucleon? How does this relate to nuclear binding or short range nucleon-nucleon correlations?
- Can one find evidence for saturation of the gluon density?
- How do quarks and gluons propagate in nuclear matter and join together to form hadrons?

# Present Knowledge

- Dramatic rise in gluon distribution discovered at HERA in 1990's.

- Gluon splitting drives the dynamics at  $x < 0.1$
- Otherwise the low  $x$  region is essentially unexplored.
- Generally expect saturation at lower  $x$  where high gluon density drives recombination – but where?

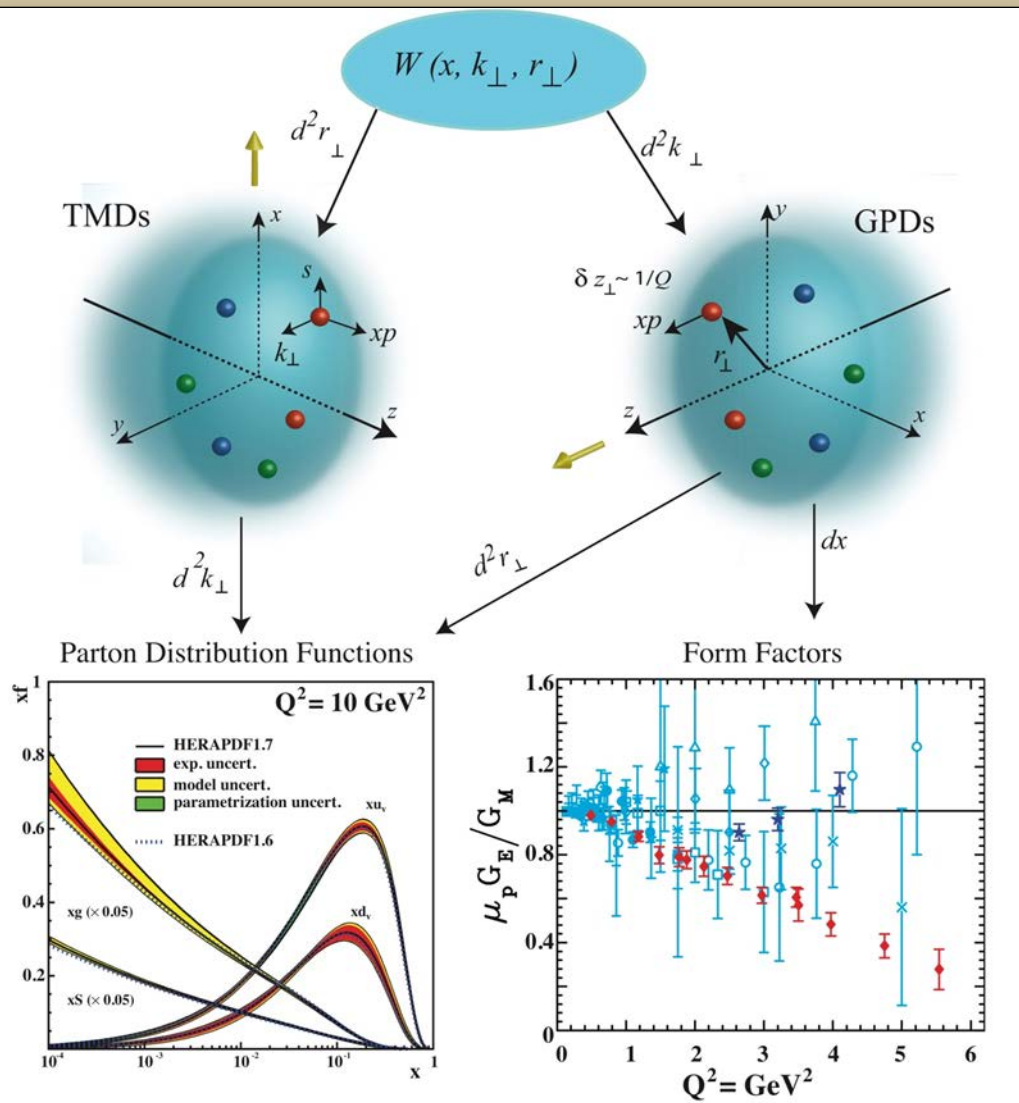

# New Paradigm for Nucleon Structure

- **JLab12**  
3D imaging of valence quarks
- **EIC**  
3D imaging of sea and gluons

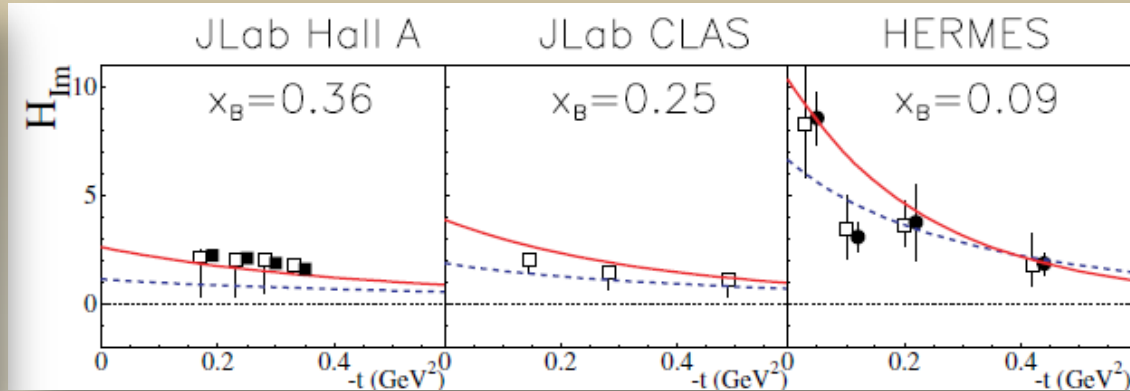

- ◆ **TMDs**
  - Confined motion in a nucleon (semi-inclusive DIS)
- ◆ **GPDs**
  - Spatial imaging (exclusive DIS)

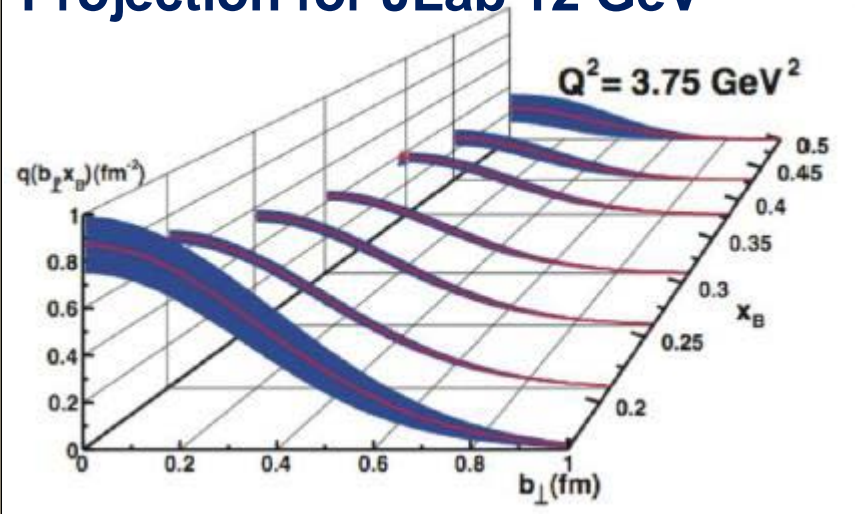

# The First Crude Images

## the GPD $H$ in $Im$ DVCS

- ○ ■ □ Different local fits
  - VGG model
  - - - KM10 global fit
- on the world data ranging from H1,ZEUS to HERMES, JLab

## Projection for JLab 12 GeV

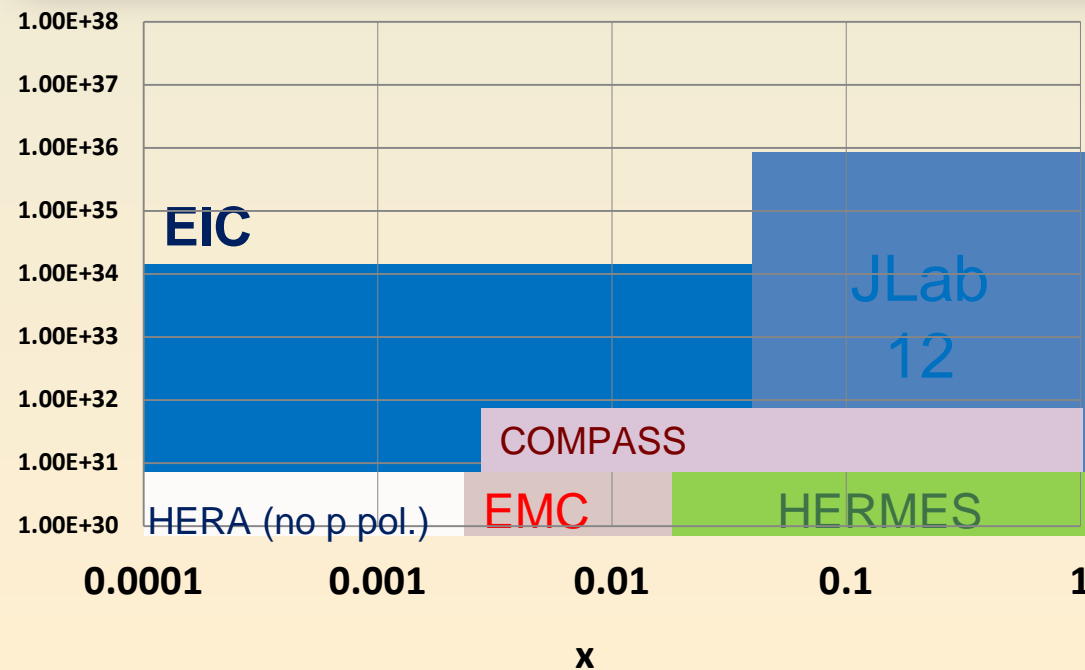

# EIC:

## The New QCD Frontier

- High Luminosity  
→  $10^{34} \text{ cm}^{-2}\text{s}^{-1}$
- Low x regime  
 $x \rightarrow 0.0001$
- High Polarization  
→ 70%

***Discovery  
Potential!***

# Spatial Imaging of Gluon Density at EIC

## ➤ Exclusive vector meson production:

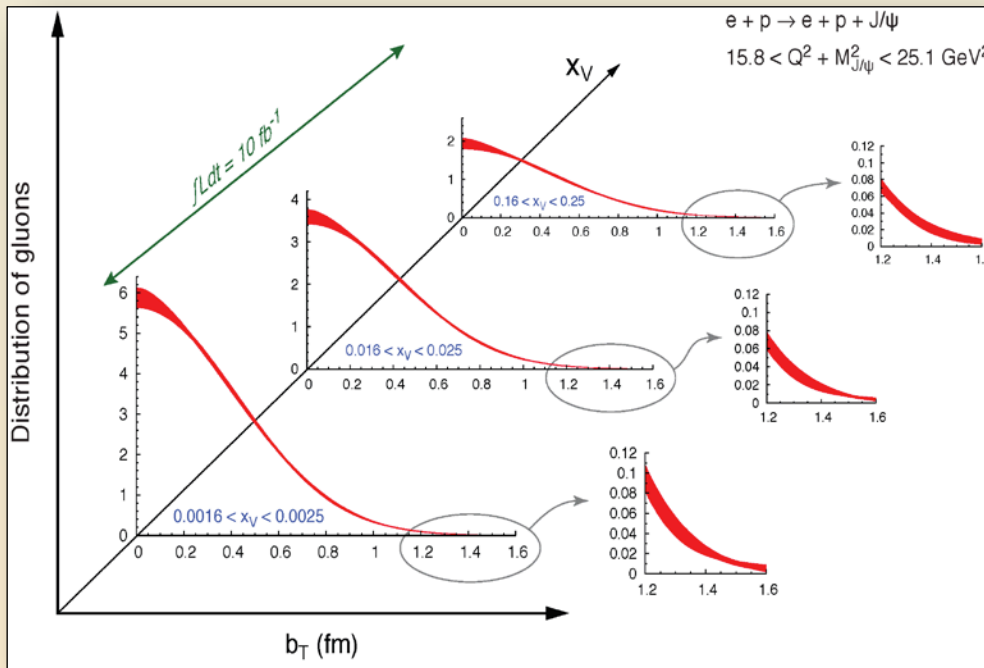

$J/\psi, \Phi, \dots$

$$\frac{d\sigma}{dx_B dQ^2 dt}$$

↑ t-dep

- ✧ Fourier transform of the t-dep
- ➔ Spatial imaging of glue density
- ✧ Resolution  $\sim 1/Q$  or  $1/M_Q$

## ➤ Gluon imaging from simulation:

$$x_V = \frac{M_{J/\psi}^2 + Q^2}{W^2 + Q^2 - M_N^2}$$

$$W^2 = (p + q)^2; \quad M_N^2 = p^2$$

Images of gluons  
from exclusive  
 $J/\psi$  production

# Helicity PDFs at an EIC

A Polarized EIC:

- Tremendous improvement on  $\Delta G$
- Good improvement in  $\Delta\Sigma$
- Spin Flavor decomposition of the Light Quark Sea

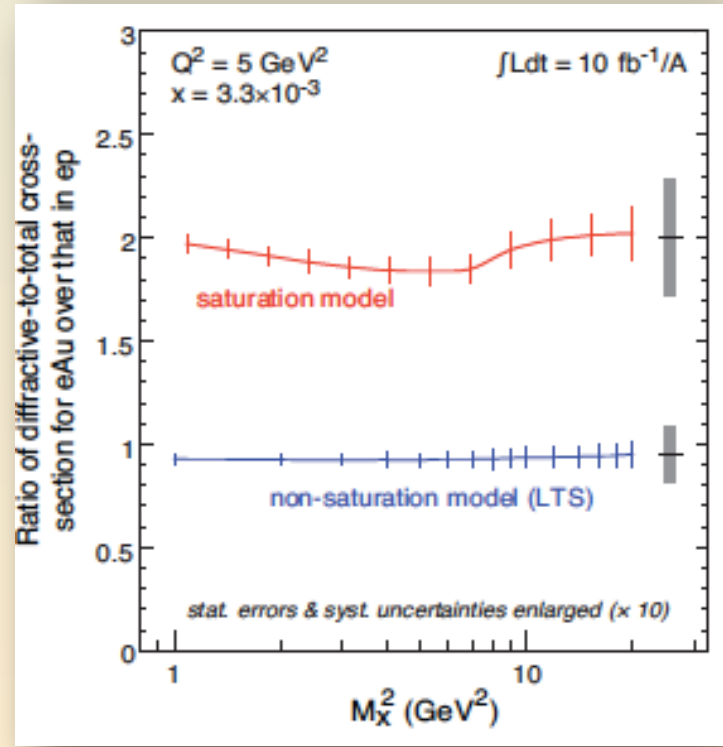

# Gluon Saturation at EIC

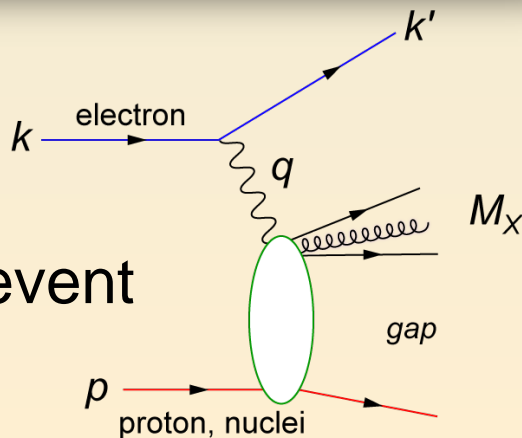

**Radiation**

**Recombination**

## Diffractive event

# Electron Ion Collider: A QCD Laboratory

## Understanding the “99%”, the glue that binds us

- Tomography of the nucleus
- Gluon and sea quarks
  - spin
  - orbital angular momentum
- QCD at high gluon density
- Propagation of color in nuclei, formation of hadrons

# EIC Properties

- Access to low values of  $x \sim 0.0001$  (not available at JLab12), which requires collisions of high energy electrons with high energy nucleons and nuclei.
- Highly polarized beams of nucleons and light ions (not available at HERA), and polarized electrons to access the spin and orbital motion of the partons.
- High luminosity to enable 3D tomography of the distributions of partons (not available at HERA).
- Collisions of electrons with atomic nuclei (not available at HERA), up to the heaviest available, to provide information on the effect of the nuclear medium on the parton distributions as well as the properties of partons traversing the nuclear medium.

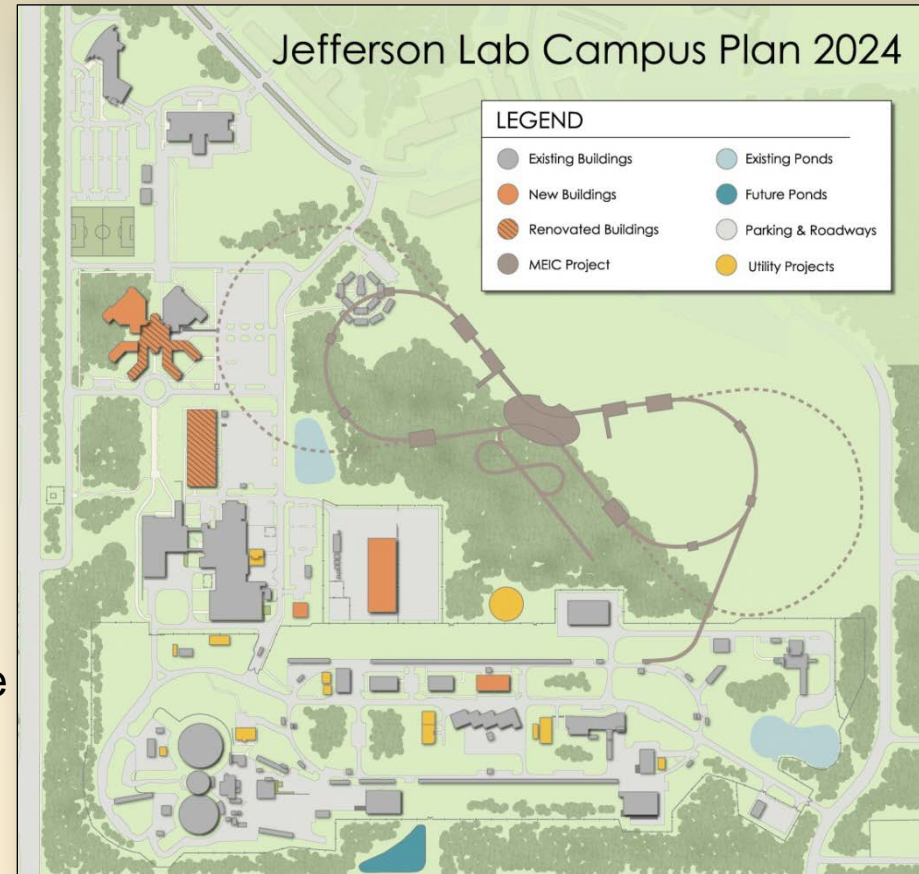

# EIC Requirements

## From the 2013 EIC White Paper:

- Highly polarized ( $\sim 70\%$ ) electron and nucleon beams
- Ion beams from deuteron to the heaviest nuclei (uranium or lead)
- Variable center of mass energies from  $\sim 20 - \sim 100$  GeV, upgradable to  $\sim 150$  GeV
- High collision luminosity  $\sim 10^{33-34} \text{ cm}^{-2}\text{s}^{-1}$
- Possibilities of having more than one interaction region

## JLab Concept

- Initial configuration (MEIC):
  - 3-12 GeV on 20-100 GeV ep/eA collider
  - Fully-polarized, longitudinal and transverse
  - Luminosity: up to few  $\times 10^{34}$  e-nucleons  $\text{cm}^{-2} \text{s}^{-1}$
- Upgradable to higher energies
  - 250 GeV protons + 20 GeV electrons

# MEIC Design Goals

## Energy

Full coverage of  $\sqrt{s}$  from **15 to 70 GeV**

Electrons **3-12 GeV**, protons **20-100 GeV**, ions **12-40 GeV/u**

## Ion species

Polarized light ions: **p, d,  $^3\text{He}$** , and possibly **Li**

Un-polarized light to heavy ions up to **A above 200 (Au, Pb)**

## At least 2 detectors

Full acceptance is critical for the primary detector

## Luminosity

**Above  $10^{33} \text{ cm}^{-2}\text{s}^{-1}$  per IP** in a *broad* CM energy range

**Maximum luminosity  $>10^{34}$**  optimized to be around  $\sqrt{s}=45 \text{ GeV}$

## Polarization

At IP: longitudinal for both beams, transverse for ions only

**All polarizations  $>70\%$**

## Upgrade to higher energies and luminosity possible

**20 GeV** electron, **250 GeV** proton, and **100 GeV/u** ion

**Design goals consistent with the White Paper requirements**

# EIC Realization Imagined

*Assumes endorsement for an EIC at the next NSAC Long Range Plan*

*Assumes relevant accelerator R&D for down-select process done around 2016*

# Summary & Outlook

- Science case is much advanced → white paper
- Common set of facility requirements – 2 viable facility designs are emerging
- Support of Hot and Cold QCD communities is essential
- Must articulate the science case for NP community and also broader audience
  - US leadership in nuclear science
  - US leadership in accelerator science and technology
- NSAC LRP Recommendation → CD-0
