Λ_c baryon production at future EIC

Friday, 29 January 2021 12:00 (5 minutes)

In high energy collisions, heavy quarks (c, b) are predominately produced in the initial hard scattering process. The relative ratio of different heavy flavor hadrons species serves as a tool to study charm quark hadronization mechanism. Recently, data from p+p, p+A, and A+A collisions at RHIC and LHC showed that the Λ_c^+/D^0 ratio is considerably larger than the fragmentation baseline. The high luminosity e+p and e+A collisions in the future Electron-Ion Collider (EIC) at Brookhaven National Laboratory would allow us to systematically investigate the Λ_c production over a broad kinematic region, which will shed detail insights on charm hadrochemistry and charm-quark hadronization. In this talk, I will present the reconstruction capability study for Λ_c^+ baryons at the future EIC experiment utilizing an all silicon tracker based on next generation MAPS technology. Physics projections on the measurement of Λ_c^+/D^0 ratio in e+p collisions in the future EIC will be presented.
