

CMS Experiment at the LHC, CERN

Data recorded: 2016-Jul-07 12:00:20.388864 GMT

Run / Event / LS: 276495 / 223808853 / 188

Evidence for Higgs boson decay to a pair of muons from the CMS experiment

proton-proton collisions at

$\sqrt{s} = 13$ TeV

Nan Lu (California Institute of Technology)

Brookhaven National Laboratory

Particle Physics Seminar

October 29, 2020

Caltech

The Standard Model Higgs Boson

- Quarks, charged leptons, W/Z bosons acquire mass through the Brout-Englert-Higgs (BEH) mechanism in the Standard Model
- Higgs boson physics is one of the most important goals of LHC physics program and the next generation collider experiments

Status of Higgs boson coupling measurements

- Higgs boson couplings to **W and Z boson** (Run 1), **3rd generation fermions** t, b, τ (Run 1+2) have been established
- $H \rightarrow \mu\mu$: currently, most experimental sensitive channel to probe **Higgs boson coupling to 2nd-generation fermion** at LHC
- **topic of the talk today: latest result from CMS experiment on $H \rightarrow \mu\mu$ search using full Run 2 data (CMS-HIG-19-006, submitted to JHEP)**

EPJC 79 (2019) 421

Where to look: Higgs boson mass

- The Higgs boson mass m_H is a free parameter in the SM.
Once m_H is known, all Higgs boson couplings to Standard Model particles are fixed
- Most precise m_H measurement currently: **$\sim 0.11\%$**
precision by CMS experiment

CMS

Phys. Lett. B 805 (2020) 135425

Higgs mass used in $H \rightarrow \mu\mu$ search

Energy Frontier: Large Hadron Collider

- pp and Heavy Ion collisions (Pb-Pb, p-Pb, Xe-Xe, ...)
- pp collision
 - about **5%** of data is delivered so far
 - 13-14 TeV in Run 3, 14 TeV HL-LHC
3000 fb⁻¹

Run 2 data-taking

- Excellent operation of the LHC and performance of the CMS detector in Run 2
- A large dataset recorded in Run 2 with high efficiency and being analyzed:
- **137 fb⁻¹** of **13 TeV** pp collision data collected by CMS in total after certification for physics (**93.7%** of CMS recorded data)

How many $H \rightarrow \mu\mu$ events produced in Run 2 ?

48 pb

3.8 pb

Small Branching Ratio $BR(H \rightarrow \mu\mu)$: 0.02%

137 fb⁻¹ at 13 TeV

production modes	ggF	VBF	WH	ZH	ttH	total ggF+VBF+ WH+ZH+ttH
$H \rightarrow \mu\mu$ events produced in Run 2 at 13 TeV (137 fb ⁻¹)	1431	112	40	26	15	1624

2.2 pb

0.5 pb

About 1624 events produced at LHC

How many events are reconstructed by CMS and selected by offline analysis?

CMS detector

CMS DETECTOR

Total weight : 14,000 tonnes
Overall diameter : 15.0 m
Overall length : 28.7 m
Magnetic field : 3.8 T

STEEL RETURN YOKE
12,500 tonnes

$$\sigma/p_T \approx 1.5 \cdot 10^{-4} p_T + 0.005$$

SILICON TRACKERS
Pixel (100x150 μm) $\sim 16\text{m}^2 \sim 66\text{M}$ channels
Microstrips (80x180 μm) $\sim 200\text{m}^2 \sim 9.6\text{M}$ channels

SUPERCONDUCTING SOLENOID
Niobium titanium coil carrying $\sim 18,000\text{A}$

MUON CHAMBERS
Barrel: 250 Drift Tube, 480 Resistive Plate Chambers
Endcaps: 468 Cathode Strip, 432 Resistive Plate Chambers

PRESHOWER
Silicon strips $\sim 16\text{m}^2 \sim 137,000$ channels

FORWARD CALORIMETER
Steel + Quartz fibres $\sim 2,000$ Channels

CRYSTAL ELECTROMAGNETIC CALORIMETER (ECAL)
 $\sim 76,000$ scintillating PbWO_4 crystals

HADRON CALORIMETER (HCAL)
Brass + Plastic scintillator $\sim 7,000$ channels

HCAL Readout by hybrid photo-diodes now replaced by silicon photomultipliers (Phase-1 upgrade)

muon p_T resolution

$H \rightarrow \mu\mu$: muon p_T resolution dominated by measurements by tracker

Muon reconstruction performance in Run 2

Excellent muon performance in Run 2:

- $|\eta| < 2.4$ within geometrical acceptance of muon detectors
- high efficiency for reconstruction and identification $> 96\%$, isolation $> 95\%$
- good dimuon resolution: $1 \sim 2\%$ for $Z \rightarrow \mu\mu$ events

Recap: CMS $H \rightarrow \mu\mu$ search with 2016 data

Observed (expected) significance 0.9σ (1.0σ)

Boosted Decision Tree (BDT) trained targeting ggH and VBF signals

Categorization based on BDT output score and the maximum $|\eta|$ of the two muons

[Phys. Rev. Lett. 122 \(2019\) 021801](#)

$H \rightarrow \mu\mu$ characteristics

$H \rightarrow \mu\mu$ narrow signal on top of smoothly falling background in $m_{\mu\mu}$:

- Narrow signal peak: $\sigma(m_{\mu\mu}) \sim 1.4 \text{ GeV}$

signal significance roughly $\propto 1/\sqrt{\sigma(m_{\mu\mu})}$

new improvements to $\sigma(m_{\mu\mu})$:

- final state radiation (FSR) photon recovery: 2% improvement on $\sigma(m_{\mu\mu})$, 3% increase in signal yield
- correction to muon pT by including interaction point position information: 3-10% increase on $\sigma(m_{\mu\mu})$
- Large background: $S/B \sim 1/500$, how to reduce background is a challenge
 - main background: Drell-Yan(DY) $Z \rightarrow \mu\mu$
 - Others: top (important for ttH channel), electroweak production $Z \rightarrow \mu\mu + \text{jets}$ (for VBF), ttZ(for ttH), diboson (for VH-leptonic)

$H \rightarrow \mu\mu$ event selection and categorization

Event selection: expect **954 signal events** selected in $110 < m_{\mu\mu} < 150$ GeV, efficiency **59%** :

- pass single muon high level trigger
- require two isolated opposite charged muons: leading muon $p_T > 26$ (2016, 2018)/29 (2017), sub-leading muon $p_T > 20$ GeV

Analysis strategy:

- ggH, ttH, VH: mass fit method
 - data-driven background estimate
 - binned fit of dimuon invariant mass to data
- VBF: MC template fit method
 - background estimated with MC
 - binned fit of final discriminant to data

ggH, ttH, VH channels: mass fit method

ggH channel: overview

ggH channel includes all events not selected by VBF, ttH and VH channels

- largest signal yield
 - about 890 signals
- smallest S/B
 - best S/B category: $S/B \sim 1/50$
- main background: DY process
- BDT used to separate signal from background
 - BDT uncorrelated with $m_{\mu\mu}$ to allow using the mass fit method
- Five ggH categories defined:
 - aim to optimize overall best ggH channel significance

ggH channel: BDT

- BDT encoding as much relevant information as possible
 - training variables: muon and jet kinematic information, N_{jets}
 - **signal MC weighted $\sim m_{\mu\mu}/\sigma_{\mu\mu}$** : increase the importance of high-resolution signal events
 - technique used in ttH and VH categories too
 - simplify the categorization optimization

• BDT Training variables

(di)muon:

- $pT_{\mu\mu}$
- $\text{rapidity}_{\mu\mu}$
- $\cos(\theta_{\text{CS}})$, ϕ_{CS} computed in dimuon Collins-Soper rest frame
- $pT_{\mu 1}/m_{\mu\mu}$, $pT_{\mu 2}/m_{\mu\mu}$
- $\eta(\mu 1)$
- $\eta(\mu 2)$

muon and jet:

- pT_{j1} , pT_{j2}
- η_{j1}
- N_{jets}
- $\Delta\eta_{jj}$, m_{jj} , $\Delta\phi_{jj}$
- Zeppenfeld variable

$$z^* = \frac{y_{\mu\mu} - (y_{j1} + y_{j2})/2}{|y_{j1} - y_{j2}|}$$

- $\min\text{-}\Delta\phi(\mu\mu, (j1, j2))$
- $\min\text{-}\Delta\eta(\mu\mu, (j1, j2))$

Signal modeling: double-sided Crystal Ball function

ggH channel: background modeling

- background modeled with analytical functions: core-pdf method

$$B_{cat}(m_{\mu\mu}, \vec{\alpha}, \vec{\beta}) = N_B \times F_{core}(m_{\mu\mu}, \vec{\alpha}) \times T_{SMF}(m_{\mu\mu}, \vec{\beta})$$

Background shape: same core function in all categories

- discrete profiling method[1] choose one from three functional forms during the fit to the data
 - main background DY process physics motivated functions
 - (1) modified Breit–Wigner $mBW(m_{\mu\mu}; m_Z, \Gamma_Z, a_1, a_2, a_3) = \frac{e^{a_2 m_{\mu\mu} + a_3 m_{\mu\mu}^2}}{(m_{\mu\mu} - m_Z)^{a_1} + (\Gamma_Z/2)^{a_1}}$
 - (2) shape derived from the FEWZ v3.1 generator (NNLO in QCD and NLO in EW) $\times$ a third-order Bernstein polynomial
 - agnostic functions
 - (3) a sum of two exponential functions

[1]: 2015 J. Inst. 10 P04015

ggH channel: background modeling

- background model with analytical functions: core-pdf method

$$B_{cat}(m_{\mu\mu}, \vec{\alpha}, \vec{\beta}) = N_B \times F_{core}(m_{\mu\mu}, \vec{\alpha}) \times T_{SMF}(m_{\mu\mu}, \vec{\beta})$$

background yield:
uncorrelated across categories

- per-category shape modulation: account for shape variations in categories
 - 2nd or 3rd order Chebyshev polynomial
 - parameters uncorrelated across ggH categories

- Bias from background modeling has < 1% effect on measured signal rate, thus neglected
 - bias on signal extraction < 20% of post-fit uncertainty on the signal yield

Core-pdf method for background modeling brings 10% improvement in sensitivity compared to 2016 data analysis

ggH channel: results

Observed (expected)
significance: 0.99σ (1.56σ)
@ $m_H = 125.38$ GeV

ggH candidate event

ggH event candidate

$m_{\mu\mu} = 125.46 \text{ GeV}$, $\sigma(m_{\mu\mu}) = 1.33 \text{ GeV}$

ttH channel: overview

- ttH leptonic: extra leptons (e or μ)
 - additional MVA identification for leptons *PRL 122, 132003 (2019)* to reduce background with non-prompt leptons from $t\bar{t}$ and DY
- ttH hadronic: $N_{\text{jets}} \geq 3$, no extra lepton
 - hadronic top tagging *PRL 122, 011803 (2019)* used to increase signal purity

three ttH hadronic categories
main background: $t\bar{t}$

two ttH leptonic categories
main bkg: ttZ

ttH channel: results

Fit strategy and signal modeling similar to ggH categories

- background functional form using agnostic functions:
 - second-order Bernstein polynomial for ttH-hadronic
 - exponential functions for ttH-leptonic
- observed (expected) significance: 1.20σ (0.54σ), $m_H = 125.38$ GeV

Category	Sig.	t $\bar{t}$ H (%)	ggH (%)	VH (%)	tH (%)	VBF+b $\bar{b}$ H (%)	HWHM (GeV)	Bkg. in HWHM	S/(S+B) (%) in HWHM	S/ $\sqrt{B}$ in HWHM	Data in HWHM

Run / Event / LS: 274420 / 119660942 / 136

**hadronic decays of
the two top quarks**

ttH-hadronic event candidate
 $m_{\mu\mu} = 125.40 \text{ GeV}$, $\sigma(m_{\mu\mu}) = 1.24 \text{ GeV}$

VH channel: overview

- One extra lepton in WH category, additional same-flavor opposite-charge lepton pair for ZH category
- Additional MVA identification for leptons (as in ttH categories) to increase signal purity and reject non-prompt leptons coming from $t\bar{t}$ and DY
- Optimized lepton pairing forming the Higgs boson candidate

3 WH categories

2 ZH categories

VH channel: results

Fit strategy and signal modeling
similar to ggH categories

- Background functional form:
 - modified Breit-Wigner => due to background dominated by WZ and ZZ
- Observed (expected) significance:
2.02 σ (0.42 σ), $m_H = 125.38$ GeV

Category	Sig.	WH (%)	qqZH (%)	ggZH (%)	$t\bar{t}H + tH$ (%)	HWHM (GeV)	Bkg. in HWHM	S/(S + B) (%) in HWHM	S/ $\sqrt{B}$ in HWHM	Data in HWHM

$m_{\mu\mu} = 123.18 \text{ GeV}$, $\sigma(m_{\mu\mu}) = 1.03 \text{ GeV}$

WH, $W \rightarrow e\nu$

electron

VBF: MC template fit method

VBF channel: overview

- Signal event yield in VBF categories is small: ~ 48 signal events expected
- New strategy based on MC:
 - good MC simulation precision in modeling VBF Higgs signal and relevant backgrounds: Drell-Yan $Z \rightarrow \mu\mu$ + jets, electroweak Z + jets production
 - CMS has performed intensive measurements on main background DY and electroweak Z+2jets
 - sideband region to control the background prediction from MC

- Deep neural network (DNN) output score used as final discriminant
 - 20% improvement compared to mass fit method
 - Analysis strategy similar to the CMS study on electroweak Z+2jets production:
 - *JHEP* 10 (2013) 101 (7 TeV), *Eur. Phys. J. C* 75 (2015) 66 (8 TeV observation), *Eur. Phys. J. C* 78 (2018) 589 (13 TeV measurement)

VBF channel: Deep Neural Network

- DNN trained on kinematic information of the two muons and VBF signature (24 variables):
 - **Dimuon variables:** $m_{\mu\mu}$, $\sigma(m_{\mu\mu})$, $m_{\mu\mu}/\sigma(m_{\mu\mu})$, $p_{T\mu\mu}$, $\log(p_{T\mu\mu})$, $y_{\mu\mu}$, $\cos\theta^*$, ϕ^*
 - **Dijet variables:** p_T , η , ϕ of jet_1 , jet_2 , $\log(m_{jj})$, m_{jj} , $\Delta\eta_{jj}$
 - **Soft track-jet variables:** $N_{\text{soft jet} > 5 \text{ GeV}}$, $H_{T \text{ soft jet} > 2 \text{ GeV}}$ (H_T : scalar sum of p_T):
 - jets reconstructed by charged tracks associated to the primary vertex
 - not associated with jet_1 , jet_2 or the two muons
 - **Kinematic variable of the dimuon ($\mu\mu$) and dijet system** most sensitive variable: $m_{\mu\mu}$
 - $\min(\Delta\eta(\mu\mu, \text{jet}_1), \Delta\eta(\mu\mu, \text{jet}_2))$
 - Zeppenfeld variable
 - pT balance ratio of $\mu\mu$ and jets $R(p_T) = \frac{|\vec{p}_T^{\mu\mu} + \vec{p}_T^{jj}|}{p_T^{\mu\mu} + p_T(j_1) + p_T(j_2)}$
 - **Quark/gluon likelihood:** $\text{jet}_1, \text{jet}_2$ (jets in DY process can originate from gluons)

VBF channel: fitting strategy

Simultaneously fit in 6 VBF categories in total (signal and sideband regions in each year 2016, 17 and 18)

- DY separated into DY+2jet and DY+pileup/noise (for the latter: event yield is a free parameter in the fit)

Full Run 2

signal region
 $115 < m_{\mu\mu} < 135$ GeV
 137 fb^{-1} (13 TeV)

Full Run 2

sideband region: constraint background
 $110 < m_{\mu\mu} < 115$ GeV or $135 < m_{\mu\mu} < 150$ GeV
 137 fb^{-1} (13 TeV)

VBF channel: results

- Achieve unprecedented signal purity in high DNN bins
 - last DNN bin signal purity **42%**
 - **main background: electroweak Z+2jets, DY+2jets**
- **20% improvement in sensitivity** compared to $m_{\mu\mu}$ mass fit method
- Observed (expected) significance: 2.40σ (1.77σ), $m_H = 125.38$ GeV

DNN bin	Signal	VBF (%)	ggH (%)	Bkg. $\pm \Delta B$	$S/(S+B)$ (%)	$S/\sqrt{B}$	Data
1-3	19.5	30	70	8894 ± 67	0.22	0.21	8815
4-6	11.6	57	43	394 ± 8	2.90	0.59	388

Evidence of $H \rightarrow \mu\mu$

@ $m_H = 125.38$ GeV:

- Run 2: observed (expected) significance 2.95σ (2.46σ)
- Run 2 + Run 1: observed (expected) significance 2.98σ (2.48σ),
1% improvement by adding Run 1 result

Signal strength measurement of $H \rightarrow \mu\mu$

Combined signal strength of all channels : $\mu = \sigma B(H \rightarrow \mu\mu)_{obs} / \sigma B(H \rightarrow \mu\mu)_{SM}$

$$\mu = 1.19^{+0.44}_{-0.42} = 1.19^{+0.41}_{-0.39}(stats.)^{+0.10}_{-0.11}(theo.)^{+0.12}_{-0.10}(exp.)^{+0.07}_{-0.06}(MCstats.)$$

measurement dominated by statistical uncertainty in data

Boson and fermion-mediated production processes

Higgs production modes:

Fermion mediated

$$\mu_{gg,ttH}^{\mu\mu} = \mu_{ggH}^{\mu\mu} = \mu_{ttH}^{\mu\mu}$$

Boson mediated

$$\mu_{VBF,VH}^{\mu\mu} = \mu_{VBF}^{\mu\mu} = \mu_{VH}^{\mu\mu}$$

2D measurement signal strength
in the **vector boson** vs **fermion**
mediated production modes
consistent with SM within 1σ

best-fit value:

$$(\mu_{VBF,VH}^{\mu\mu}, \mu_{ggH,ttH}^{\mu\mu}) = (0.66, 1.84)$$

Higgs boson coupling to muons

- Precision of κ_μ improved from 89% to 19% in two years.
- 35% improvement in analysis strategy

$$\kappa_\mu = 1.13^{+0.21}_{-0.22} \text{ at 68\% CL}$$

$$\kappa_\mu = 0.79^{+0.58}_{-0.79} \text{ at 68\% CL}$$

EPJC 79 (2019) 421

Summary of improvements

- 2016 data analysis (Phys.Rev.Lett.122.021801):
 - bump hunt in $m(\mu\mu)$ spectrum targeting ggH and VBF signals
 - expected sensitivity with 2016 data of 36 fb^{-1} : 1.0σ
- Full Run 2 data analysis strategy has **35% improvement** wrt 2016 data analysis:
 - muon pT corrections: (1) final state radiation recovery (2) muon track momentum correction using interaction point position information
 - new analysis strategy for VBF channel: MC template fits to allow reaching unprecedented signal purity (42% in last DNN bin)
 - significantly improved analysis strategy for the ggH channel:
 - improved BDT, aware of the dimuon resolution
 - robust background modeling with less free parameters: core-pdf method
 - new categories for VH and ttH signals, less explored previously

Comparison with ATLAS results

ATLAS:

- Expected significance 1.7σ , observed 2.0σ
- Signal strength: $\mu = 1.2 \pm 0.58(\text{stats.})_{-0.08}^{+0.13}(\text{theory})_{-0.03}^{+0.07}(\text{exp.}) \pm 0.10(\text{spurious})$

CMS:

- Expected significance 2.5σ , observed 3.0σ
- Signal strength: $\mu = 1.19_{-0.39}^{+0.41}(\text{stats.})_{-0.11}^{+0.10}(\text{theory})_{-0.10}^{+0.12}(\text{exp.})_{-0.06}^{+0.07}(\text{MCstats.})$

Main difference in the result of two experiments: $\sigma_{\text{CMS}}(m_{\mu\mu})/\sigma_{\text{ATLAS}}(m_{\mu\mu}) = 48\sim 60\%$
 Analysis techniques employed by two experiments have rather similar performance

New possibilities in $H \rightarrow \mu\mu$ with Phase-2 detector upgrades for HL-LHC

An intensive Phase-2 detector upgrade program on-going to meet the challenge of the HL-LHC:

- basic goal is to maintain the current CMS detector performance

pileup up to 140 (200) at HL-LHC

for today: selected areas related to muons

Tracking

- New full silicon detector: forward extension $\eta \sim 4$, finer granularity

CMS-TDR-014

Muon system

- New muon chambers based on Gas Electron Multiplier and Resistive Plate Chamber technology
 - enhance muon trigger and measurement at high η
 - extends η coverage for global muons from 2.4 to 2.8 in HL-LHC
- Upgrades of the electronics

CMS-TDR-016

- Run 3 GE1/1: $1.6 < |\eta| < 2.18$

- Phase-II HL-LHC

- RE34/1: $1.8 < |\eta| < 2.4$

- GE2/1: $1.6 < |\eta| < 2.4$

- ME0: $2.0 < |\eta| < 2.8$

First new Phase-2 detector installed in CMS

- Installation of the first GE1/1 disc (negative side) finished in October 2019
- Second GE1/1 disc (positive side) finished in September 2020

New timing dimension measurement at HL-LHC

CMS MIP timing detector (30-50 ps time resolution for minimum ionizing particles) guards against adverse pileup effect on muon reconstruction at HL-LHC

CMS-TDR-020

Prospect of precision measurement of Higgs coupling to muons

- Projection at HL-LHC combining ATLAS and CMS: 4.3% precision
- Complementary with proposed future Higgs factories

[arxiv:1902.00134](https://arxiv.org/abs/1902.00134)

FCC CDR: Eur. Phys. J. C (2019) 79:474

Summary

-  **CMS observed (expected) 3.0σ (2.5σ)** experimental evidence for $H \rightarrow \mu\mu$ decay using full Run 2 data: (CERN press release, CMS paper submitted to JHEP) :
-  Higgs boson coupling measured with **19% precision with CMS, in agreement** with Standard Model prediction
$$\kappa_\mu = 1.13^{+0.21}_{-0.22} \text{ at 68\% CL}$$
-  What's next: LHC data in **Run 3 and HL-LHC** will enable the **observation and a precise measurement** of κ_μ through $H \rightarrow \mu\mu$

Thank you!

backup slides

Particle Flow Algorithm and physics objects

- Muons are well measured physics objects with high efficiency and purity, excellent resolution: combining tracks in the tracker and muon system

Higgs boson physics

The discovery of the Higgs boson by ATLAS and CMS experiments at LHC in 2012 started the era of precision Higgs boson property measurement:

- to test the SM, use Higgs as a tool to search for new physics beyond the SM
- one of the major physics goals at LHC and next generation colliders

(1) Any CP-mixing in Higgs couplings?

CMS HIG-20-006 PAS

(2) Is Higgs responsible for a possible 1st order phase transition inducing baryon asymmetry?

Fcc CDR

Higgs boson couplings probes Beyond the SM physics (examples):

Vector boson fusion (VBF)
3.8 pb ~7%

Associated Higgs production with a W or Z boson (VH):
2.2 pb ~ 4%

Associated Higgs production with a top quark pair (ttH): 0.5 pb ~1%

Framework for coupling-strength measurements

Leading order tree-level motivated framework with assumptions:

- Signal observed in different channels originate from a single resonance $m_H \sim 125.36$ GeV
- Narrow width approximation.
- Lagrangian tensor structure: SM hypothesis $J^{CP} = 0^{++}$

Yield for the production and decay $i \rightarrow H \rightarrow f$ parametrized in terms of coupling scale factors scaling the SM cross sections and widths

Coupling scale factors:

$$\sigma \cdot B(i \rightarrow H \rightarrow f) = \frac{\sigma_i \cdot \Gamma_f}{\Gamma_H} = \frac{\sigma_i^{SM} \cdot \Gamma_f^{SM}}{\Gamma_H^{SM}} \cdot \left(\frac{\kappa_i^2 \kappa_f^2}{\kappa_H^2} \right)$$

Coupling scale factors:

$$\kappa_i^2 = \frac{\sigma_i}{\sigma_i^{SM}}$$

Production

$$\kappa_f^2 = \frac{\Gamma_f}{\Gamma_f^{SM}}$$

Decay

$$\kappa_H^2 = \frac{\sum \Gamma_f}{\sum \Gamma_f^{SM}}$$

Total width

Higgs boson width Γ_H not experimentally constrained to a meaningful precision at the LHC:

- No assumptions on Γ_H : Ratios of coupling strength can be measured
- Make assumption on Γ_H : absolute coupling strengths can be measured.

Higgs boson mass measurements

- m_H precision exceeding Run 1 result: $\sim 0.11\%$ precision by CMS, 0.19% by ATLAS

Phys. Lett. B 805 (2020) 135425

CMS

Phys. Lett. B 784 (2018) 345

ATLAS

$H \rightarrow cc$

- Currently best 95% CL limit on $\sigma(VH) \times B(H \rightarrow cc)$: < 70 (expected: 37) $\times SM$, based on 36.1 /fb CMS data at 13 TeV

JHEP 03 (2020) 131

Physics objection selection

muons:

- $|\eta| < 2.4$
- leading muon $p_T > 26$ (2016, 2018)/29 (2017)
- sub-leading muon $p_T > 20$ GeV
- loose isolation criteria
- medium muon ID
- global muon
- correction to the muon p_T : final state photon recovery and geo-fit correction

Top tagging

- Only used in the ttH category
- MVA-based resolved hadronic top tag with 3 jets [PRL **122**, 011803 (2019)]

Jets:

- $p_T > 25$ GeV, $|\eta| < 4.7$
- reject jets originate from pileup
 - MVA pile-up jet identification
- Calibration on jet energy

B-jet tagging

- $p_T > 25$ GeV and $|\eta| < 2.5$ within tracker coverage
- DeepCSV b-tagging algorithm
 - Loose (85% efficiency, 10% mis-ID)
 - medium (70% efficiency, 1% mis-ID)

Event simulation

Monte Carlo (MC) simulation samples:

Process	Generator (Perturbative order)	Parton shower	Cross section	Additional corrections
ggH	MADGRAPH5_aMC@NLO (NLO QCD)	PYTHIA	N3LO QCD, NLO EW	$p_T(H)$ from NNLOPS
VBF	POWHEG (NLO QCD)	PYTHIA dipole shower	NNLO QCD, NLO EW	—

Single top quark	POWHEG/MADGRAPH5_aMC@NLO (NLO QCD)	PYTHIA	NLO QCD	—
Diboson (VV)	POWHEG/MADGRAPH5_aMC@NLO (NLO QCD)	PYTHIA	NLO QCD	NNLO/NLO K factors
gg → ZZ	MCFM (LO)	PYTHIA	LO	NNLO/LO K factors
t $\bar{t}$ V, t $\bar{t}$ VV	MADGRAPH5_aMC@NLO (NLO QCD)	PYTHIA	NLO QCD	—
Triboson (VVV)	MADGRAPH5_aMC@NLO (NLO QCD)	PYTHIA	NLO QCD	—

ggH:

- Higgs p_T distribution reweighted to match POWHEG NNLOPS predictions

Drell-Yan:

- Madgraph5_aMC@NLO generator with up to two partons in the final state at the ME level
- Dedicated sample targeting the VBF phase-space created to reduce MC stats uncertainty

Collins - Soper angles

- θ_{CS} : the angle between the collinear muons (μ) in the dimuon rest frame and the line that bisects the acute angle between the colliding partons (p)
- ϕ_{CS} : the angle between the dimuon plane and the plane of the colliding partons

Ranking of systematic uncertainties

- Leading systematic uncertainty: VBF signal parton shower uncertainty
- No strong shifts from central values or constraint on the size of systematic uncertainty

VBF: 2016 signal and sideband region

VBF: 2017 signal and sideband region

VBF: 2018 signal and sideband region

VBF channel: systematic uncertainties

Experimental uncertainties

- Jet energy scale and resolution uncertainties
- the rate of DY process with a jet not matched to a generator level jet, contained by the low DNN score events.
- MC stats uncertainty
- 2016 and 2017 a 20% uncertainty of the correction for the modeling of the inefficiency in the L1 trigger in region $2.4 < \eta < 3$
- luminosity uncertainty 2.5%
- modeling of the pileup conditions during data taking
- measurement of muon identification, isolation and trigger efficiencies
- muon energy scale and resolution
- quark/gluon likelihood reweights

Theory uncertainties

- QCD scale, pdf, parton shower (PS) uncertainty for signal and background is included. In particular VBF and electroweak Zjj-EW PS uncertainty: difference between HERWIG (angular-ordered) and PYTHIA (dipole shower)

Sources of systematic uncertainties and correlation

Signal composition

$H \rightarrow \mu\mu$: Run 1 and Run 2 combination

$H \rightarrow \mu\mu$: Higgs boson coupling to muons

ttH channel selection

Selection	ttH hadronic	ttH leptonic
Number of b quark jets	> 0 medium or > 1 loose b-tagged jets	
Number of leptons	2	3 or 4
Lepton charge	$\sum q(\ell) = 0$	$N(\ell) = 3 (4) \rightarrow \sum q(\ell) = \pm 1 (0)$
Jet multiplicity ($p_T > 25 \text{ GeV}, \eta < 4.7$)	≥ 3	≥ 2
Leading jet p_T	$> 50 \text{ GeV}$	$> 35 \text{ GeV}$
Jet triplet mass	$100 < m_{jjj} < 300 \text{ GeV}$	—
Z mass veto	—	$ m_{\ell\ell} - m_Z > 10 \text{ GeV}$
Low mass resonance veto	—	$m_{\ell\ell} > 12 \text{ GeV}$

VH-leptonic channel

Observable	WH leptonic		ZH leptonic	
	$\mu\mu\mu$	$\mu\mu e$	4μ	$2\mu 2e$
Number of loose (medium) b-tagged jets	≤ 1 (0)	≤ 1 (0)	≤ 1 (0)	≤ 1 (0)
Number of selected muons	$= 3$	$= 2$	$= 4$	$= 2$
Number of selected electrons	$= 0$	$= 1$	$= 0$	$= 2$
Lepton charge ($q(\ell)$)	$\sum q(\ell) = \pm 1$		$\sum q(\ell) = 0$	
Low-mass resonance veto	$m_{\ell\ell} > 12 \text{ GeV}$			
N($\mu^+ \mu^-$) pairs with $110 < m_{\mu\mu} < 150 \text{ GeV}$	≥ 1	$= 1$	≥ 1	$= 1$
N($\mu^+ \mu^-$) pairs with $ m_{\mu\mu} - m_Z < 10 \text{ GeV}$	$= 0$	$= 0$	$= 1$	$= 0$
N($e^+ e^-$) pairs with $ m_{ee} - m_Z < 20 \text{ GeV}$	$= 0$	$= 0$	$= 1$	$= 1$

Functional forms:

WH-cat1

$$\text{BWZGamma}(m_{\mu\mu}; a, f, m_Z, \Gamma_Z) = f \times \text{BWZ}(m_{\mu\mu}; a, m_Z, \Gamma_Z) + (1 - f) \times \frac{e^{am_{\mu\mu}}}{m_{\mu\mu}^2}$$

Other categories

$$\text{BWZ}(m_{\mu\mu}; a, m_Z, \Gamma_Z) = \frac{\Gamma_Z e^{am_{\mu\mu}}}{(m_{\mu\mu} - m_Z)^2 + (\Gamma_Z/2)^2}$$

$H \rightarrow \mu\mu$: mass spectra

Note: this spectra is not from the fit, because VBF channel does not use mass fit method

137 fb⁻¹ (13 TeV)

137 fb⁻¹ (13 TeV)

Muon momentum resolution

$$\sigma/p_T \approx 1\% \text{ @ } 50\text{GeV to } 10\% \text{ @ } 1\text{TeV}$$

$H \rightarrow \mu\mu$ events:

- typical p_T of muons: 50~60 GeV
- muon p_T resolution $\sigma(p_T)/p_T$ dominated by measurements by tracker

Rochester Correction

Muon resolution in Z peak region

New timing dimension measurement at HL-LHC

CMS-TDR-020

- Time resolution of **30-50 ps** for minimum ionizing particles (MIPs)
- Thin layer between tracker and calorimeters, covering $|\eta| < 3$

BTL sensor design - LYSO:Ce

Lutetium-yttrium orthosilicate crystals activated with cerium (LYSO:Ce) as scintillator
 $3 \times 3 \times 57 \text{ mm}^3$.

Stochastic fluctuations in the time-of-arrival of photons detected at the SiPM:

$$\sigma_t^{\text{photostatistics}} \propto \sqrt{1/N_{p.e.}} \propto \sqrt{1/(E_{\text{dep}} \times LY \times LCE \times PDE)}$$

- Dense (7.1 g/cm^3): a MIP deposits $E_{\text{dep}} \sim 4.2 \text{ MeV}$ including impact angle (0.86 MeV/mm)
- Bright: light yield (LY) $\sim 40\text{k}$ photons/MeV.
- Excellent radiation tolerance

BTL sensor design - SiPM

Silicon Photomultipliers as photo sensors

- Compact, fast (single photon resolution of 100 ps), insensitive to magnetic fields, radiation hard
- SiPM active area of 9 mm², coupled to LYSO using glue: light collection efficiency (LCE) 15%
- Optimal SiPM cell size: 15 μ m, balance between radiation tolerance and photon detection efficiency
- Gain: $1.5 - 4 \times 10^5$
- Photo detection efficiency (PDE) : 20-40%

Muon efficiency with precision timing

CMS-TDR-020

Phase-2 muon trigger improvement with GEM detectors

Possible scenarios of future colliders
