## Towards stability of NLO corrections for DIS-like processes in High-Energy Factorization

The NLO corrections to DIS-like process, initiated by gauge-invariant operator  $\text{tr}[G_{\mu\nu}G^{\mu\nu}]$  (Where  $G_{\mu\nu}$  is field-strength tensor of QCD) had been studied in Refs. [1,2], including one-loop and real-emission NLO corrections. This “Higgs-initiated DIS” process is a simplest small- $x$  physics process for which it is most convenient to study problem of convergence of perturbative series, which arises in High-Energy Factorization (kT-factorization) at NLO. In the standard BFKL-type NLO calculation (called “MRK-subtraction” in Ref. [2]) the usual over-subtraction problem in collinear region of NLO correction is found. An improved “modified-MRK (MMRK) approximation”, interpolating between MRK and collinear limits of scattering amplitude, is proposed to solve the over-subtraction problem. The evolution equation based on MMRK approximation is proposed [2] and studied. The improved physical behavior of NLO correction with MMRK subtraction is demonstrated [2].
